

MAXTHERMO-GITTA GROUP CORP MAXIMUM ELECTRONIC CO., LTD

Temperature PID Controllers

OPERATIONAL MANUAL

MC 5438 / MC 5538 / MC 5638
MC 5738 / MC 5838

Display unit & Indication lamps

PV	= Measured value display
SV	= Set value display
AL1	= Alarm 1 output lamp
AL2	= Alarm 2 output lamp
AL3	= Alarm 3 output lamp
OU1	= Control output 1 lamp
OU2	= Control output 2 lamp
AT	= Autotuning lamp
MAN	= Manual mode lamp
10% ~ 100%	= Manipulated output value display
PRG	= Programmable mode lamp
1-8	= Segment-in-process display lamp
RP	= Ramping mode lamp (programmable mode only)
SK	= Soaking mode lamp (programmable mode only)

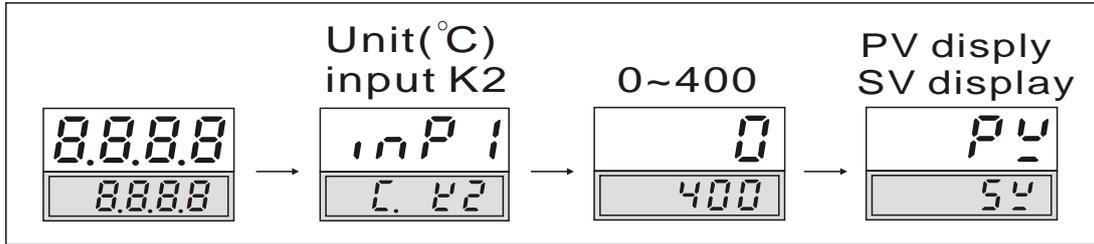

Operation keys

F/S	= Function & Set key
←	= Shift key
↓	= Down key
↑	= Up key
↑ (3 sec)	Press 3 sec while the SV is not flashing = Used for returning to initial window
↓ (3 sec)	Press 3 sec while in level selection window = Used for calling up lock function
↓ (3 sec)	Press 3 sec while in pv/sv initial window = Used for stopping output and SV window will display "HOLD", ↓ (3 sec) press 3 sec again to regain output (This function is available only while OUTM is selected 1 or 2)
F/S (3 sec)	Press 3 sec while in pv/sv initial window = Used for calling up level selection
F/S (3 sec)	Press 3 sec while in level selection window = Used for entering each level

Operation keys (programmable mode only)

These keys are only operated in PV/SV initial window	
↑ (3SEC) Run	PRG lights, RP or SK flashes The executing segment lamp lights
↓ (3SEC) Pause	PRG, RP and SK light The executing segment lamp lights
↑ + F/S Jump	Jump to the next segment, press ↑ first
↓ + F/S Stop	Turn off all lamps which used for programmable mode, press ↓ first
Refer to arrow When PRG Lights (No PRG light in MC-5438)	

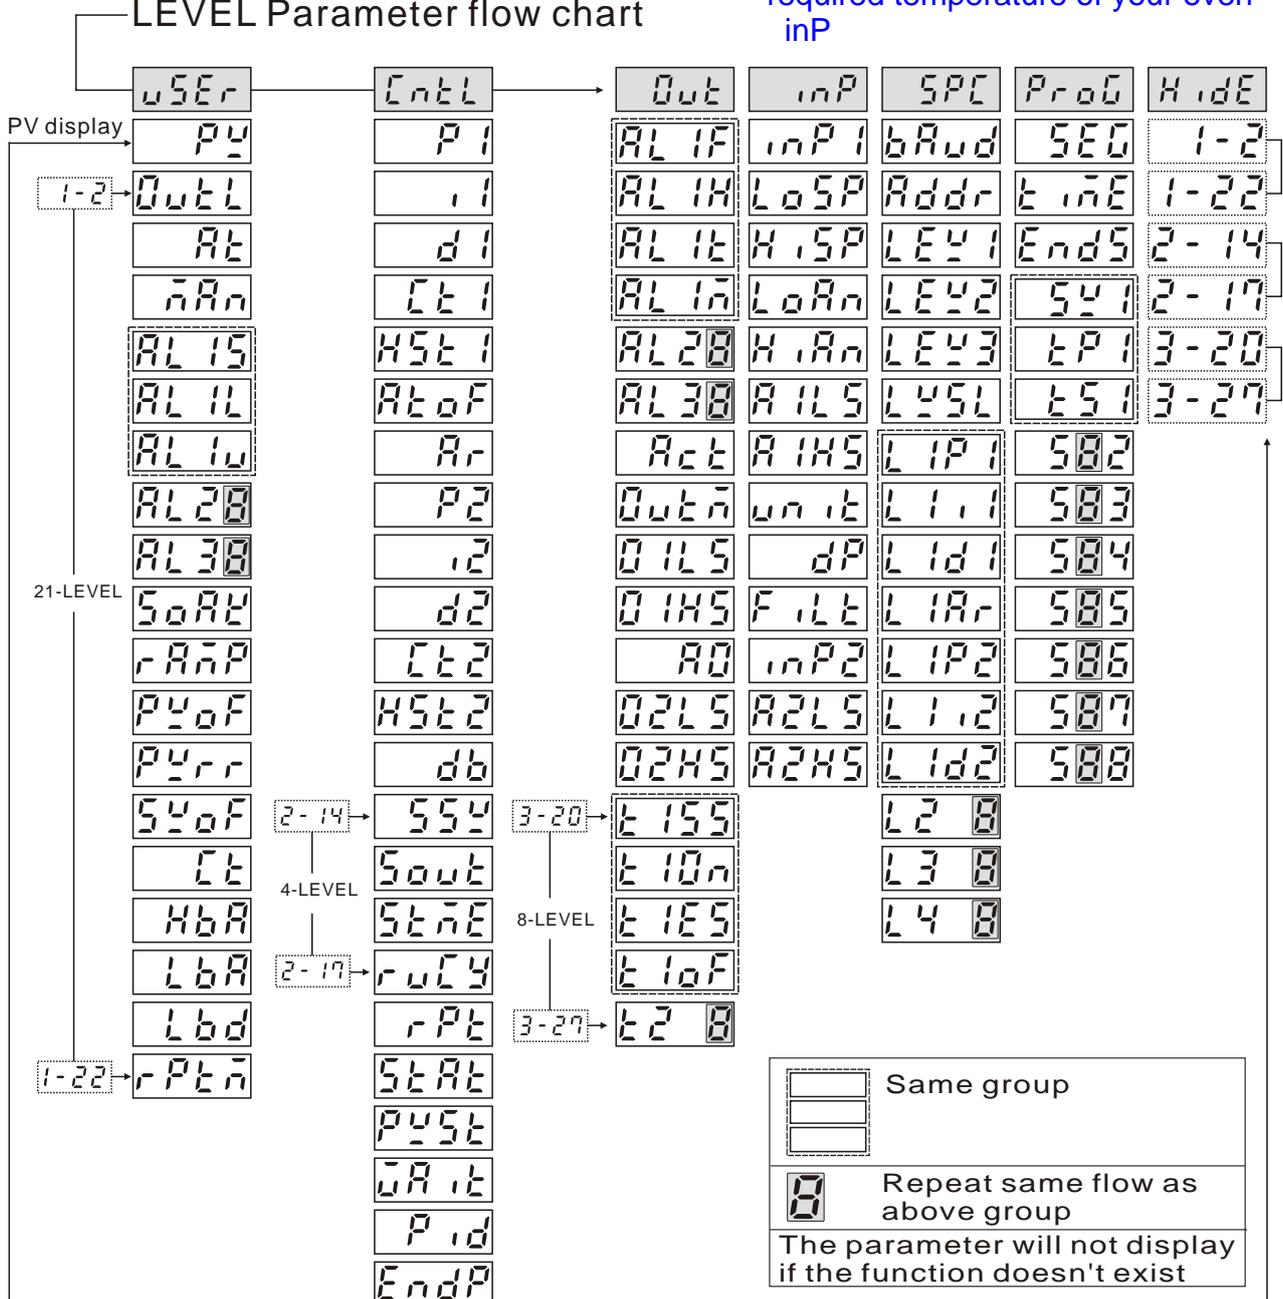

Window checks display after turning on power

Here at PvoF you can eliminate the measuring error, when the input type is set:
 PvoF

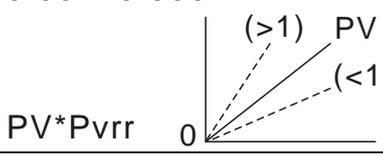

Here you can select the input type: inP1 should be j1 - j5 according to the required temperature of your oven inP

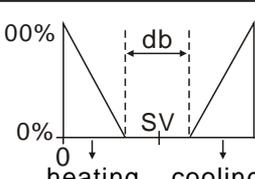

LEVEL Parameter flow chart

Parameter	DESCRIPTION	RANGE	Initial value
<i>PV</i> Pv	Process value	LoSP~HiSP	
<i>SV</i> Sv	Set value	LoSP~HiSP	0.0

USER ▼

<i>OutL</i> OutL	Output percentage	0.0~100.0%	0.0
<i>At</i> At	Auto tuning	No / yes	no
<i>Man</i> Man	Manual mode	Man1 =power failure memory Man2 =no memory No =non	no
<i>AL1S</i> AL1S	Alarm 1 set value	If ALIF set at 1 or 2 range=-200~200 If ALIF set at 3 or 4 range=LoSP~HiSP If ALIF set at 10 range =1-8 segment ending	10.0
<i>AL1L</i> AL1L	Alarm 1 lower set value	0~200	10.0
<i>AL1u</i> AL1u	Alarm 1 upper set value	0~200	10.0
<i>AL2S AL3S</i>	AL2S / AL3S For operating functions refer to the above descriptions		
<i>SoAK</i> SoAK	Perform only when AL1M set at 8 or9 refer to explanation on page 7	0.00~99.59 (h.m)	0.00

PARAMETER EXPLANATIONS

SoAK	It performs only when AL1M set at 8 or 9, and the controller is without program function. If you set AL1M at 8, then AL1 shifts to soak function and contactor is normal open; if you set AL1M at 9, then AL1 shifts to soak function but contactor is normal close.
rAmP	It's for setting that PV will be increased or decreased by set value if the controller is without program function. For example: If rAmP is set at 10 , then the PV will increase 10~ per minute, but if PV is higher than SV, then the PV will decrease 10~ per minute.
PvoF	It's for setting that if PV is not correct to SV, then you can adjust it with (+) or (-).
Pvrr	It's for adjusting PV be more accurate. The formulation is $PV(\text{now}) = PV(\text{pre}) \times Pvrr + PVOF$.
SvoF	It's for setting that if SV is not correct to PV, then you can adjust it with (+) or (-).
Ct	It's for detecting current to find if the heater is broken. Display value:0.0~100.0A. When you order CT function,a small C.T. is included.

HbA	<p>Heater break alarm set value. Set value range: 0.1 ~100.0 A. For Example: a. When Low or no current flow, but control output is On, and $CT \leq HBA$, it means heater is broken, then the alarm is on. a.b. When over current or short-circuit, but control output is off, and $CT \geq HBA$, then the alarm is on. (The CT and HBA parameter works only when you order Heater break alarm function).</p>
LbA & Lbd	<p>They are parameters for Loop Break Alarm. For Example: When Out1:0.0%, LBA time elapsed, PV should be below LBD, if it is still within LBD determination range, alarm is on . When Out1:100.0%, LBA time elapsed, PV should be upper LBD, if it is still within LBD determination range, alarm is on . (LBA and LBD works by software setting, no need to order extra components).</p>
rPtm	<p>It shows how many times of running program at the moment. This parameter works when your PID controller opens on program function.</p>
Ct1	<p>It's for setting ON-OFF cyclic time of output 1, normally it is set at 0 for 4~20Ma output, 1 for SSR drive output, 15 for relay output.</p>
Ar	<p>It's a solution for preventing over-shooting. This parameter makes Integral delay. The setting range is from 0 to 100%, initial value 100% means integral will perform when PV reaches proportional band, but if you set Ar at 50%, it means integral will perform when PV reaches 50% of proportional band.</p>
SSV	<p>It's for setting soft start range, when you want the heating system doesn't go up too quick at the beginning, you may set SSV. For Example: You want the temperature going up slowly under 120°, you may set SSV at 120.</p>
Sout	<p>It is for setting the output percentage under SSV , if you want 50% of output, you may set it at 50 .</p>
StmE	<p>It is for setting soft start failure time. When the PID controller reaches the StmE time, but PV doesn't reach SSV, it means soft start failure, then Controller will revert to SV.</p>
RuCy	<p>Motor valve cyclic time, it means the time from close to open or from open to close.</p>
rPt	<p>It's for setting how many times of program process to be executed.</p>
StAt	<p>It is for setting when it starts program procedure, cold is by manual, Rset is to start after power on. Hot is to start from memory of power failure.</p>
wAit	<p>It is for setting the value that SV will wait PV if PV goes up slowly than SV.</p>

Pid	In this parameter, you can choose the controller with one PID performing only or level-PID (LPID) performing, if you choose LPID then you can set 4 levels of different PID.
Endp	It is for setting when program is ending, one program only or to be continued.
tiSS	t1SS is for time signal alarm to set which segment you want it to start alarm (in program function). For Example: You want it alarms at segment 2, then you may set it to 2 .
tiOn	t1On is to set what time do you want alarm to perform. For Example: You want it alarms at 6 min. (if your segment 2 set at 10 min.), you may set it to 6 , then the alarm will perform in segment 2, but start from 6 th min.
t1Es	t1ES is to set which segment you want to end alarm (in program function). For Example: You want it ends at segment 5, then you may set it to 5 .
T1oF	T1oF is to set what time do you want alarm to end. For Example: You want it ends at 3 min. (if your segment 5 set at 5 min.), you may set it to 3 , then the alarm will end at 3 rd min. of segment 5.
LvSL	LvSL is for level PID use, which level of PID you have set, then you can watch its PID value. For Example: You set it to 3 , then you can watch L3P1, L3I1, L3d1 But in first you need to set Lpid at Pid parameter in level Cntl and Lev1 to Lev 3 in SPC level.

Table 5. Error information

Display	description
<i>in1E</i>	Input 1 error
<i>AdCF</i>	A/D converter failed
<i>CJCE</i>	Cold junction compensation failed
<i>in2E</i>	Input 2 error
<i>PV</i> Blinks	PV exceeds set Ranges
<i>rRnF</i>	Ram failed
<i>intF</i>	Interface failed
<i>AutF</i>	Auto tuning failed

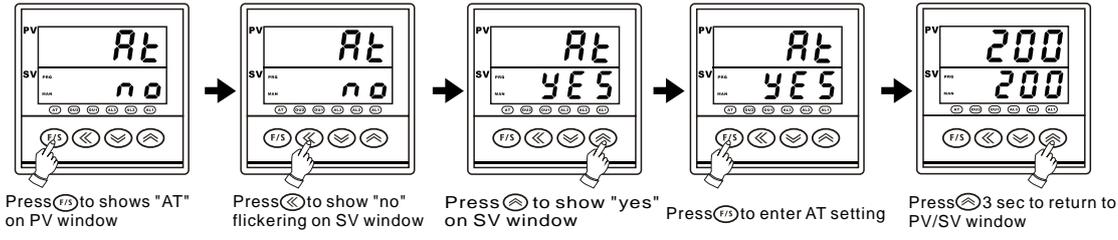

A How to set "SV" example: SV set at 200 °C

B How to set "AL1S,AL2S,AL3S" example: alarm 1 set at 20 °C

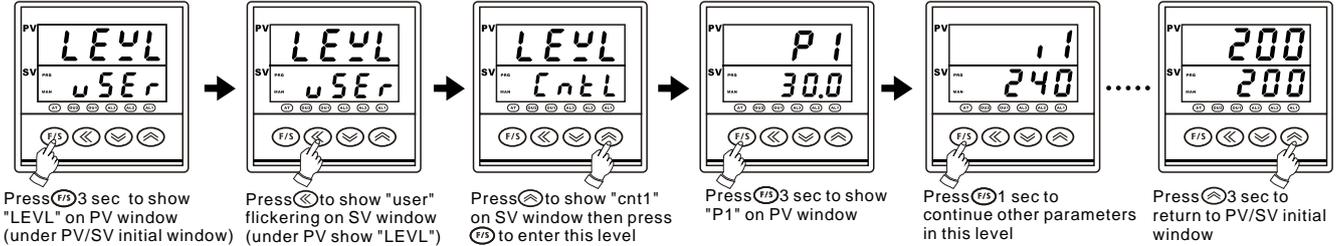

C How to set "AT" (auto tuning)

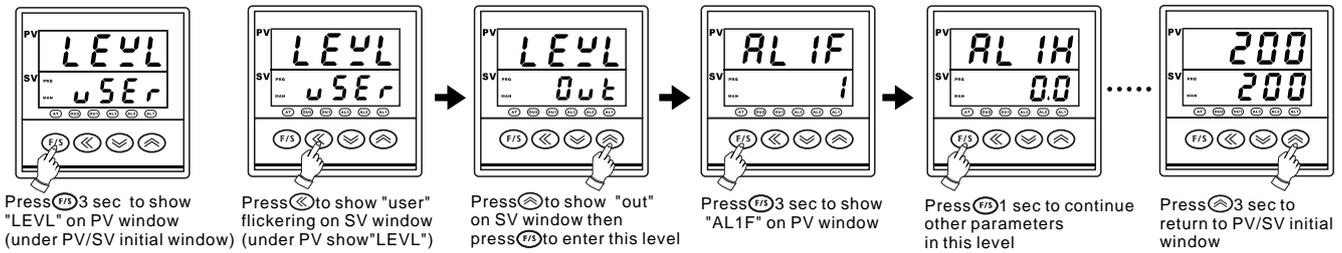

D How to enter different "level" for setting parameter

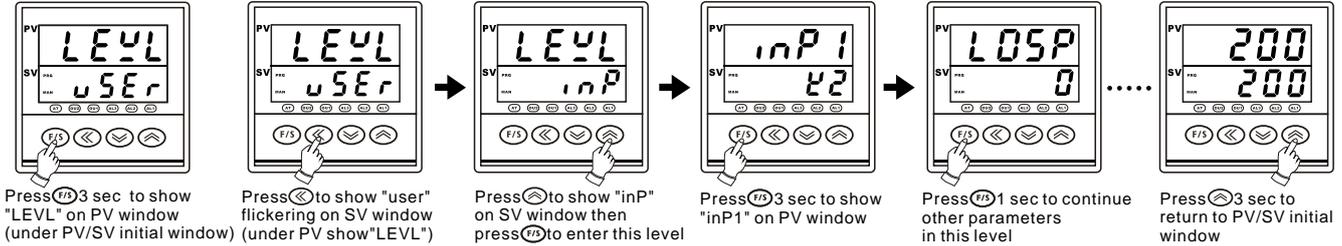

(1) Enter "CntL" level

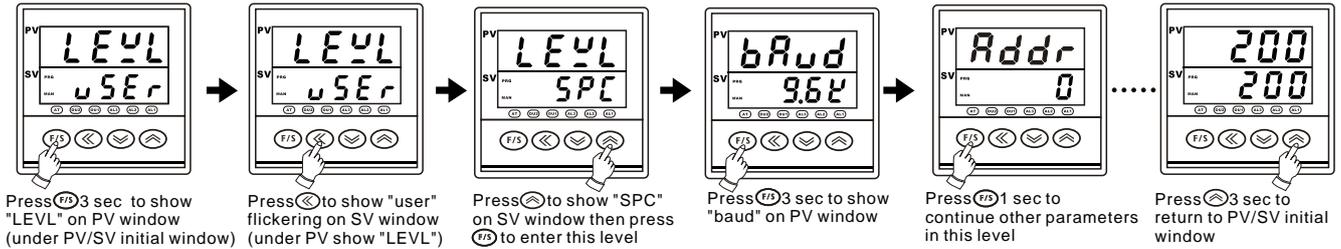

(2) Enter "Out" level

(3) Enter "inP" level

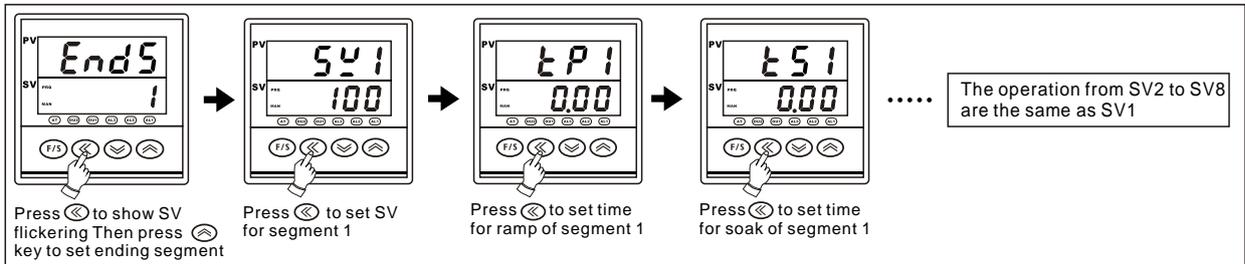

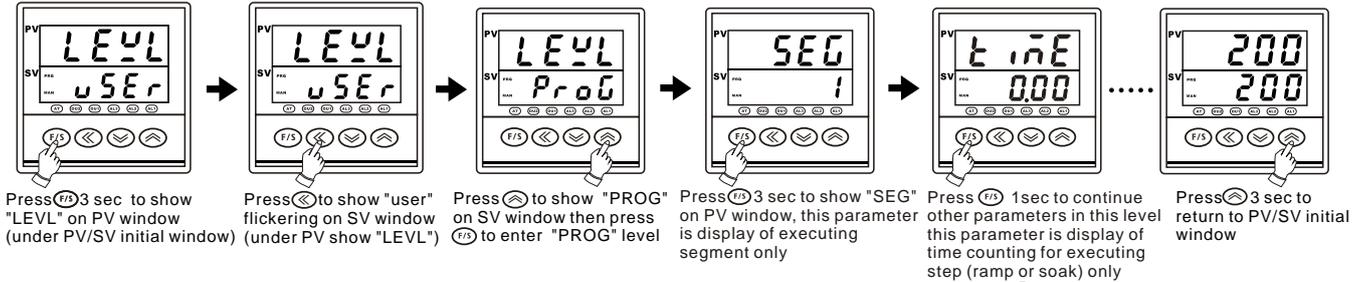

(4) Enter "SpC" level

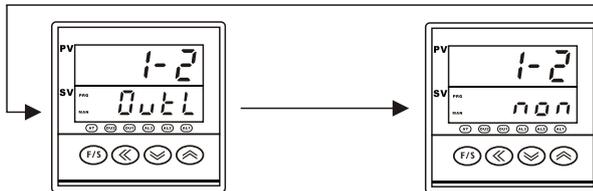

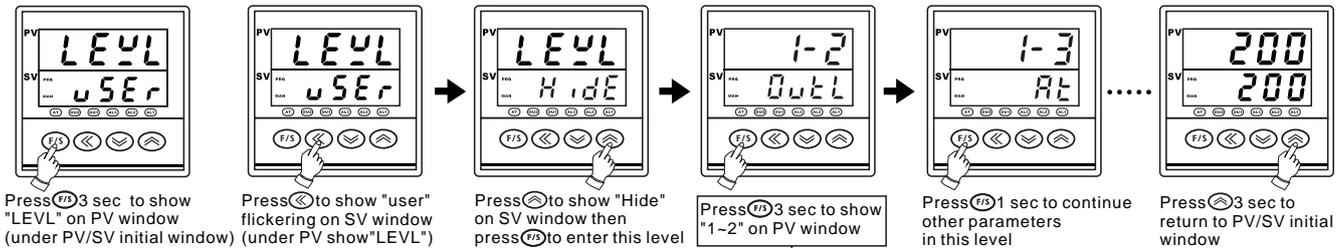

(5) Enter program level

* "OUTM" in "out" level must be selected at "8" or "9" (refer to fig 3)

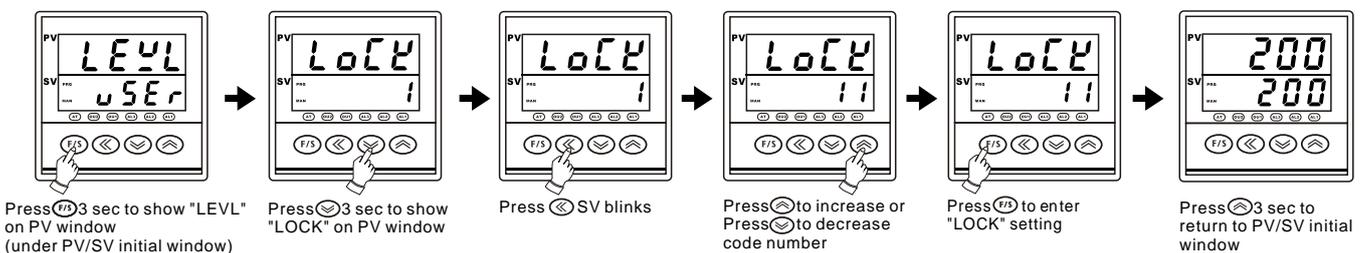

(6) Enter "Hide" level

In this level, the user can arrange parameter order or hiding from NO. 1-2 to 1-22, 2-14 to 2-17 and 3-20 to 3-27 (please refer to level parameter flow chart in page 1), but same parameter can not be arranged in 2 positions in the same time, for example you want to arrange "OUTL" to 1-3 you need to cancel it in 1-2 first. When you want to cancel or hide it you need to select "non" on the "SV"

If you select "non" in 1-2 and press **F15** to enter then 1-2 will not display anything but if you select other parameter in 1-2, it will display which parameter.
The operation in 1-2 to 1-22, 2-14 to 2-17 and 3-20 to 3-27 all are the same.

E How to set "LoCK" function

Code number for Lock function

110	all parameters are locked except PV
1101	all parameters are locked except SV
111	open "USER" level and above
122	open "CNTL" level and above
1111	open "OUT" level (Except OUTM) and above
222	open "INP" level and above
1100	open "SPC" level and above
2200	open "PROG" level and above
1122	open "HIDE" level and above
1234	open "USER" and "PROG" level only

F. How to modify input

This series controller provides free input for T/C and RTD, it doesn't need to modify hardware except analog input.

1. Analog input hardware modification

(Refer to S1~S8 on PC board back)

S1 & S2 are shorted with COM. originally,

so it needs to open S1 or S1 & S2 and to short some pads as drawing.

INPUT	S1	S2	S3	S4	S5	S6	S7	S8
TC/RTD	○	○	✕	✕	✕	✕	✕	✕
0~20MA	✕	○	✕	✕	○	✕	✕	✕
4~20MA	✕	○	✕	✕	○	✕	✕	✕
0~100MV	✕	✕	○	✕	✕	○	✕	✕
0~1V	✕	✕	✕	○	✕	○	✕	✕
0~5V	✕	✕	✕	✕	✕	○	✕	○
1~5V	✕	✕	✕	✕	✕	○	○	✕
0~10V	✕	✕	✕	✕	✕	○	✕	○

[○] short [✕] open

2. Analog input software modification

°Select "Lin" in "inpl" parameter

°Set "LoAn" in "inp" level to lowest range

°Set "HiAn" in "inp" level to highest range

3. Analog input calibration

°Enter "A1LS" parameter in "inp" level

°Provide signal for lowest range and wait for 3 sec then keep pressing  key

°Enter "A1HS" parameter in "inp" level

°Provide signal for highest range and wait for 3 sec then keep pressing  key

°Return to PV/SV initial window and provide signal for lowest range again then check if PV equals to LoAn

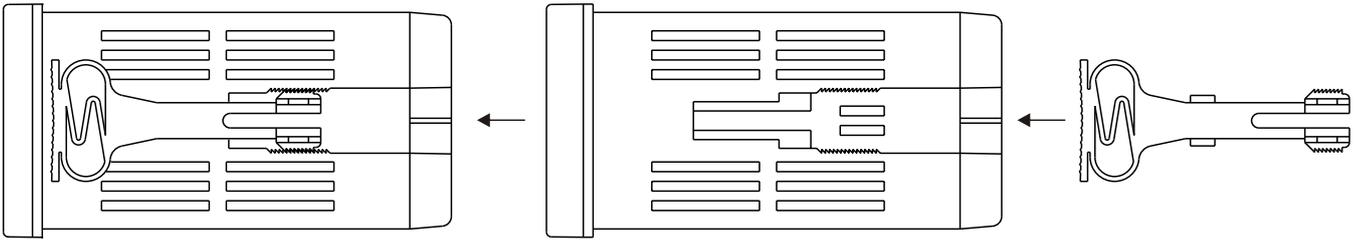

°Provide signal for highest range again then check if PV equals to HiAn

If it is not accuracy after calibrating, please repeat above procedure again

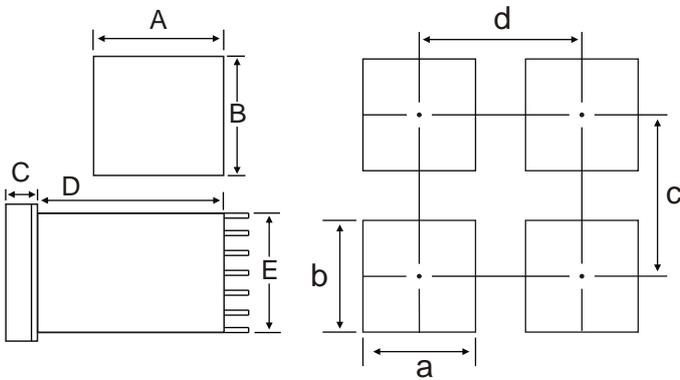

G. Communication Protocol (see fig 14)

SPECIFICATIONS

PV Input	Type of Input	TC (K,J,T,R,E,S,B,N) RTD (Pt100, JPt100) Linear(1-5V, 4-20mA)
	Input Sampling Time	300 ms
Indication	PV/SV Indication	4-digit
	Constant Value Storage System	Non-volatile memory (E ² PROM)
Control Mode	Proportional Band (P)	0.0~3000
	Integral Time (I)	0~3600
	Derivative Time (D)	0~900
	Cycle Time	0~150
	Dead Band	0.0~200.0
Output	Relay Output Relay	Contact, SPDT 3A/240VAC
	Voltage Output	Voltage Pulse
	Linear Output	4~20mA, 1-5V ,
	Motor Control Output	Open loop motor valve
Alarm	Channel	3 Channels (Optional)
Communication	Type of Communication	RS-232, RS-485
General Specifications	Power Supply Voltage & Frequency	AC 90~260V, 50/60Hz
	Power Consumption	<3.5VA
	Ambient Temperature	-10° ~ 55°
	Ambient Humidity	0~80% RH
