

Brevini® Planetary Gearboxes **Industrial Series**

Torques from 300 Nm to 35.000 Nm

Planetary solutions

Brevini® Industrial Series planetary gearboxes with its modularity, wide range of characteristics and variants, allows to meet every possible application needs for both Industrial and Mobile applications.

Questo nuovo catalogo presenta i riduttori epicicloidali DANA per applicazioni industriali. Si tratta di una gamma completa di riduttori a concezione modulare, che abbina prestazioni elevate a costi contenuti e con ingombri ridotti. Il successo commerciale che da anni accompagna questi riduttori epicicloidali DANA ne testimonia la qualità, la affidabilità, la semplicità di installazione e la ridotta manutenzione.

I riduttori industriali DANA si sviluppano progressivamente su numerose grandezze, ottimizzando le prestazioni in termini di durata e di silenziosità. Le principali caratteristiche della gamma sono :

- Grandezze armonicamente sviluppate, da 1.000 Nm a 25.000 Nm di coppia nominale.
- Esecuzione coassiale fino a 4 stadi di riduzione: rapporti da 1:3 fino a 1:3000.
- Esecuzione ortogonale fino a 4 stadi di riduzione: rapporti da 1:10 fino a 1:3000.
- Versioni in uscita: riduttore flangiato ad albero femmina, oppure femmina pendolare con giunto di serraggio o ad attacco diretto; riduttore flangiato ad albero maschio; riduttore con piedi.
- Versioni in ingresso con albero veloce, predisposizioni per motori elettrici e oleodinamici, possibilità di freni a dischi multipli.
- Una vasta proposta di accessori in ingresso, in uscita e a corredo.

La DANA garantisce tempi di consegna rapidissimi in tutto il mondo, grazie ai propri Stock & Service Centres e grazie alla capillare rete commerciale.

This new catalogue presents the DANA range of planetary gearboxes for industrial applications. This is a complete range of modular design gearboxes, and combines high performance with low cost and compact size. The many years of commercial success achieved by DANA planetary gearboxes testify to their excellent quality and reliability, simple installation and limited maintenance.

DANA's industrial planetary gearboxes come in a range of sizes to ensure optimum duration and silent running in all sorts of applications. The range's main features are:

- *A progressive selection of sizes from 1,000 Nm to 25,000 Nm nominal torque.*
- *Coaxial versions with up to 4 gear stages for ratios from 1:3 to 1:3000.*
- *Right angle versions with up to 4 gear stages for ratios from 1:10 to 1:3000.*
- *Output versions: flanged gearbox with female shaft, or shaft mounted with shrink disk or direct coupling; flanged gearbox with male shaft; foot mounted version.*
- *Input versions with high speed shaft, provision for electric and hydraulic motors, and multiple disc brake options.*
- *A vast range of input and output options and standard accessories.*

DANA guarantees ultra-short delivery times all over the world through its Stock & Service Centres and extensive sales network.

BREVINI[®]

Motion Systems

Dieser neue Katalog stellt Ihnen die Industrie-Planetengetriebe von DANA vor. Hierbei handelt es sich um ein komplettes Angebot von Getrieben nach dem Baukastenprinzip, die hohe Leistungen mit begrenzten Kosten und reduziertem Platzbedarf kombinieren. Der kommerzielle Erfolg, den diese DANA-Planetengetriebe seit Jahren verzeichnen, zeugt von Qualität, Zuverlässigkeit, Installationsfreundlichkeit und minimalem Wartungsbedarf.

Die progressiv entwickelten, zahlreichen Baugrößen der Industriegetriebe von DANA ermöglichen optimierte Leistungen in puncto Lebensdauer und Laufruhe. Die grundlegenden Merkmale der Baureihe sind:

- Fein abgestufte Baugrößen mit Nennmoment zwischen 1.000 Nm und 25.000 Nm.
- Koaxialausführung mit bis zu 4 Getriebestufen: Übersetzungen von 1:3 bis 1:3000.
- Winkelausführung mit bis zu 4 Getriebestufen: Übersetzungen von 1:10 bis 1:3000.
- Abtriebssausführungen: Flanschgetriebe mit Hohlwelle oder Aufsteck-Hohlwelle mit Sperrkupplung oder direktem Anschluss; Flanschgetriebe mit Vollwelle; Getriebe mit integrierten Funktionen.
- Antriebsausführungen mit schnell laufender Welle, Vorrüstung für Elektro- und Ölhydraulikmotoren, Möglichkeit für Lamellenbremsenmontage.
- Ein breit gefächertes Sortiment an antriebs- und abtriebsseitigem Zubehör und als Ausstattung.

DANA garantiert weltweit kurzfristige Lieferzeiten, die dank der firmeneigenen Stock & Service Centres und des feingefächerten Handelsnetzes möglich sind.

Ce nouveau catalogue présente les réducteurs épicycloïdaux DANA pour applications industrielles. Il s'agit d'une gamme complète de réducteurs de conception modulaire qui combine performances élevées, réduction des coûts et dimensions réduites. Le succès commercial qui accompagne depuis des années ces réducteurs épicycloïdaux DANA témoigne de la qualité, la fiabilité, la simplicité d'installation et l'entretien réduit.

Les réducteurs industriels DANA se développent progressivement sur plusieurs grandeurs, en optimisant les performances en termes de durée de vie et de silence de fonctionnement. Les principales caractéristiques de la gamme sont :

- Grandeurs harmonieusement développées, de 1.000 Nm à 25.000 Nm de couple nominal.
- Exécution coaxiale jusqu'à 4 étages de réduction: rapports de 1:3 jusqu'à 1:3000.
- Exécution orthogonale jusqu'à 4 étages de réduction: rapports de 1:10 jusqu'à 1:3000.
- Exécution de sortie: fixation à bride et arbre femelle, ou montage pendulaire avec frette de serrage ou entraînement direct; réducteur à arbre mâle et fixation par bride; réducteur version à pattes.
- Versions en entrée avec arbre rapide, prédispositions pour moteurs électriques et hydrauliques, avec possibilité de freins à disques multiples.
- Une large gamme d'accessoires fournis, en entrée, en sortie.

DANA garantit des délais de livraison rapides dans le monde entier, grâce à ses Stock & Service Centres et au réseau commercial dense.

Este catálogo presenta los nuevos reductores epicicloidales DANA para aplicaciones industriales. Los nuevos modelos se caracterizan por ser modulares y compactos y ofrecen prestaciones elevadas a precios razonables. El éxito comercial que acompaña a nuestros productos desde hace años constituye la mejor prueba de su calidad, fiabilidad y facilidad de mantenimiento.

Todos los tamaños de la gama son silenciosos y aseguran una larga vida útil. Principales características:

- Tamaños armonicamente desarrollados de 1.000 a 25.000 Nm de par nominal.
- Coaxiales, hasta 4 etapas de reducción: de 1:3 hasta 1:3000.
- Perpendiculares, hasta 4 etapas de reducción: de 1:10 hasta 1:3000.
- Opciones en salida: montaje por brida y eje hembra; montaje pendular con eje hueco y disco de fricción o eje hembra cilíndrico; montaje por brida y eje macho; reductor con fijación por patas.
- Opciones en entrada con eje veloz, adaptaciones para motores eléctricos y hidráulicos; frenos multidiscos.
- Amplia gama de complementos y accesorios de entrada y de salida.

Gracias a nuestros Stock & Service Centres y a nuestra red comercial podemos garantizar entregas muy rápidas en cualquier lugar del mundo.

Este novo catálogo apresenta redutores planetários DANA para aplicações industriais. Trata-se de uma linha completa de redutores com uma concepção modular, que combina desempenhos elevados com pequenas dimensões a custos reduzidos. O sucesso comercial que os redutores planetários DANA apresentam, confirmam a sua qualidade, confiabilidade, simplicidade de instalação e baixo índice de manutenção.

Os redutores industriais DANA são disponíveis em vários tamanhos, otimizando seu dimensionamento em termos de vida útil e nível de ruído. As principais características da linha são:

- *Tamanhos harmonicamente desenvolvidos, de 1.000 Nm a 25.000 Nm de torque nominal.*
- *Execução coaxial até 4 estágios de redução: relações de 1:3 até 1:3000.*
- *Execução ortogonal até 4 estágios de redução: relações de 1:10 até 1:3000.*
- *Versões de saída: redutor flangeado com eixo fêmea estriado; eixo fêmea pendular com disco de contração; eixo fêmea chavetado pendular com cubo blindado; redutor flangeado com eixo macho; redutor com pés.*
- *Versões de entrada: com eixo macho; predisposição para montagem de motores elétricos e hidráulicos; possibilidade de freios negativos multidisco.*
- *Disponibilidade de uma ampla gama de acessórios de entrada, de saída e kits.*

Graças a seu Stock & Service Centres e a sua rede comercial capilar, a DANA garante, no mundo inteiro, prazos de entrega muito rápidos.

2. DESCRIZIONI TECNICHE

Rapporto di riduzione i_{eff}

Rappresenta la relazione fra la velocità in ingresso n_1 ed uscita del riduttore n_2 . La modularità della gamma proposta da DANA permette la disponibilità di altri rapporti oltre a quelli indicati: consultare DANA per la eventuale disponibilità di ulteriori rapporti.

Coppia in uscita T_2 [Nm]

Valore della coppia in uscita riduttore riferita ad una durata di 10000 ore di funzionamento, calcolata secondo I.S.O. (D.P. 6336).

Tale valore (fattore di applicazione uguale ad 1) è indicato sia per i riduttori con versione in linea che angolari in relazione alle diverse velocità in ingresso.

Coppia massima $T_{2\text{MAX}}$ [Nm]

Coppia massima d'uscita ammessa, come punta o per brevi durate. Per azionamenti che comportano un elevato numero di avviamenti o inversioni, anche la coppia massima di impiego deve essere opportunamente limitata in relazione alla resistenza degli ingranaggi o degli alberi.

Coppia nominale T_N [Nm]

E' la coppia convenzionale che caratterizza la grandezza del riduttore. Trova corrispondenza nella coppia limite secondo I.S.O. (D.P. 6336) del rapporto più forte di ogni grandezza.

Potenza in uscita P_2 [kW]

Combinazione del valore di coppia relativo ad una durata di 10000 h alla relativa velocità in uscita riduttore. Per le versioni angolari i suddetti valori fanno riferimento ad una versione con ingresso universale. Nei casi in cui il valore della potenza nominale nell'applicazione considerata superi il valore della potenza termica del riduttore in oggetto, occorre prevedere un apposito circuito ausiliario di raffreddamento dell'olio.

Potenza termica P_T [kW]

Potenza che può essere trasmessa in continuo dal riduttore, in determinate condizioni di funzionamento, relativamente alle massime temperature ammissibili per il riduttore. Vedere il capitolo: Potenza termica.

Velocità in ingresso n_1 [min^{-1}]

I valori di velocità in ingresso indicati nel catalogo sono tre per coprire la maggior parte delle applicazioni del settore industriale.

2. TECHNICAL DESCRIPTIONS

Reduction ratio i_{eff}

It represents the ratio between gear unit input and output speed.
The modularity of the DANA range offers the availability of other ratios in addition to those given: consult DANA for the availability of further ratios.

Output torque T_2 [Nm]

Gear unit output torque referred to 10000 hours of operation, calculated according to I.S.O. (D.P. 6336).
This value (application factor equal to 1) is given for gear units with inline and right-angle versions according to the different input speeds.

Max. torque $T_{2\text{MAX}}$ [Nm]

Max. permissible output torque, as peak or for short periods.
For drives involving a high number of starts or reversals, also the max. operational torque must be opportunely limited according to the fatigue resistance of the gears or shafts.

Nominal torque T_N [Nm]

The conventional torque characterizing the size of the gear unit.
It corresponds to the limit torque according to I.S.O. (P.D. 6336) of the strongest ratio of each size.

Nominal power P_2 [kW]

A combination of the torque value relevant to a duration of 10000 h at the relative gear unit output speed.
For right-angle units the above values refer to a version with universal input.
In those cases when the nominal power value in the application considered exceeds the relevant gear unit thermal rating, a special auxiliary oil cooling circuit must be provided.

Thermal rating P_T [kW]

The power that can be transmitted continuously by the gear unit, in given operating conditions, relevant to the max. permissible temperatures for the gear unit. See chapter: Thermal rating.

Input speed n_1 [min^{-1}]

The catalogue gives three input speed values to cover the majority of applications in the industrial sector.

2. TECHNISCHE BESCHREIBUNGEN

Übersetzungszverhältnis i_{eff}

Stellt das Verhältnis zwischen Antriebsdrehzahl n_1 und Abtriebsdrehzahl n_2 dar. Das Baukastensystem der DANA Getriebe bietet neben den aufgeführten weiteren Übersetzungsverhältnisse an: wenden Sie sich an DANA für Auskünfte über weitere verfügbare Übersetzungsverhältnisse.

Abtriebsdrehzahl T_2 [Nm]

Wert der Abtriebsdrehzahl des Getriebes bezogen auf eine Dauer von 10000 Betriebsstunden, berechnet laut I.S.O. (D.P. 6336).

Dieser Wert (Anwendungsfaktor gleich 1) gilt sowohl für In-Line- wie auch für die Winkelgetriebe entsprechend den verschiedenen Antriebsdrehzahlen.

Maximales Drehmoment $T_{2\text{MAX}}$ [Nm]

Maximal zulässiges Abtriebsdrehmoment, sowohl als Spitze wie auch für kurze Dauer. Bei Anrieben mit einer hohen Anzahl von Starts oder Umsteuerungen muss auch das maximale Betriebsdrehmoment entsprechend der Ermüdbeständigkeit der Zahnräder oder Wellen begrenzt werden.

Nenndrehmoment T_N [Nm]

Das konventionelle Drehmoment, das die Getriebegröße bezeichnet.
Es entspricht dem Grenzdrehmoment laut I.S.O. (D.P. 6336) des höchsten Drehmomentverhältnisses jeder Größe.

Abtriebsleistung P_2 [kW]

Kombination des Drehmomentwerts für eine Dauer von 10000 Stunden mit der Abtriebsdrehzahl des Getriebes. Bei Winkelgetrieben beziehen sich die Werte auf eine Ausführung mit Universalantrieb. Bei allen Fällen, in denen die Nennleistung bei der in Betracht gezogenen Anwendung den Wert der Wärmeleistung des Getriebes übertrifft, muss ein geeignetes zusätzliches Kühlungssystem installiert werden.

Wärmeleistung P_T [kW]

Leistung, die kontinuierlich vom Getriebe unter bestimmten Betriebsbedingungen abgegeben werden kann in Bezug auf die für das Getriebe zulässigen Höchsttemperaturen. Siehe Kapitel: Wärmeleistung.

Antriebsdrehzahl n_1 [min^{-1}]

Die drei im Katalog angegebenen Werte der Antriebsdrehzahlen decken den größten Teil der Anwendungen des Industriebereichs ab.

2. DESCRIPTIONS TECHNIQUES

Rapport de réduction i_{eff}

Il représente la relation entre la vitesse en entrée n_1 et la vitesse en sortie du réducteur n_2 . La modularité de la gamme proposée par DANA permet de disposer d'autres rapports en plus de ceux indiqués: consulter DANA pour l'éventuelle disponibilité d'autres rapports.

Couple de sortie T_2 [Nm]

La valeur du couple de sortie se réfère à une durée de 10000 heures de fonctionnement, calculée selon I.S.O. (D.P. 6336).

Cette valeur (facteur d'application égal à 1) convient tant pour les réducteurs version en ligne que pour ceux angulaires en rapport avec les différentes vitesses en entrée.

Couple maximum $T_{2\text{MAX}}$ [Nm]

Couple maximum de sortie admissible, comme crête ou pour de courtes durées. Pour des entraînements qui comportent un nombre élevé de démarrages ou d'inversions, même le couple maximum doit être convenablement limité par rapport à la résistance des engrenages ou des arbres.

Couple nominal T_N [Nm]

C'est le couple conventionnel qui caractérise la grandeur du réducteur.

Son correspondant est le couple limite selon I.S.O. (D.P. 6336) du rapport le plus élevé de chaque grandeur.

Puissance de sortie P_2 [kW]

Combinaison de la valeur de couple pour une durée de 10000 heures avec la vitesse de sortie du réducteur correspondante. Pour les versions angulaires, les valeurs sus-citées se réfèrent à une version avec prédisposition d'entrée universelle. Si la valeur de la puissance nominale de l'application concernée dépasse la valeur de la puissance thermique du réducteur en question, il faudra alors prévoir un circuit auxiliaire de refroidissement de l'huile.

Puissance thermique P_T [kW]

Puissance qui peut être transmise en continu par le réducteur, dans des conditions de fonctionnement données, relativement aux températures maximales admissibles pour le réducteur. Voir chapitre: Puissance thermique.

Vitesse d'entrée n_1 [min^{-1}]

Les valeurs de vitesse d'entrée indiquées dans le catalogue sont au nombre de trois et permettent une adaptation optimale à la plupart des applications du secteur industriel.

2. DESCRIPCIONES TÉCNICAS

Relación de reducción i_{ef}

Es la relación entre las velocidades de entrada n_1 y de salida del reductor n_2 . La gama ofrece muchas otras relaciones además de las indicadas: contacte con DANA para obtener más información.

Par de salida T_2 [Nm]

Es el par de salida del reductor para 10000 horas de duración calculado según ISO (D.P. 6336).

El valor (factor de aplicación=1) se indica tanto para los reductores en línea como para los angulares en relación con distintas velocidades de entrada.

Par máximo $T_{2\text{MAX}}$ [Nm]

Es el máximo par de salida admisible, como pico o en intervalos cortos.

Si el accionamiento realiza arranques o inversiones frecuentes es preciso limitarlo de acuerdo con la resistencia de los engranajes o de los ejes.

Par nominal T_N [Nm]

Es el par convencional que corresponde al tamaño del reductor.

Coincide con el par límite ISO (D.P. 6336) de la relación más grande de cada tamaño.

Potencia de salida P_2 [kW]

Combina el par para 10000 horas de duración con la velocidad de salida del reductor. Los valores arriba indicados se refieren a una versión angular con entrada universal. Cuando la potencia nominal de la aplicación es mayor que la potencia térmica del reductor es preciso instalar un circuito auxiliar para enfriar el aceite.

Potencia térmica P_T [kW]

Potencia que el reductor puede transmitir de manera continua en determinadas condiciones de funcionamiento para la máxima temperatura admitida por el mismo. Véase el capítulo: Potencia térmica.

Velocidad de entrada n_1 [min^{-1}]

Los tres valores de velocidad que aparecen en el catálogo cubren la mayor parte de las aplicaciones industriales.

2. DESCRIÇÕES TÉCNICAS

Relação de redução i_{eff}

Representa a relação entre a velocidade de entrada n_1 e de saída do redutor n_2 . A modularidade da gama proposta pela DANA permite a disponibilidade de outras relações além das indicadas: consultar a DANA para obter a eventual disponibilidade de relações adicionais.

Torque de saída T_2 [Nm]

Valor do torque de saída do redutor com referência a uma duração de 10000 horas de funcionamento, calculada conforme a ISO (D.P. 6336). Esse valor (fator de aplicação igual a 1) é indicado para os reductores nas versões em linha e angulares em relação às diversas velocidades de entrada.

Torque máximo $T_{2\text{MAX}}$ [Nm]

Torque máximo de saída admissível, como pontas ou para durações curtas. Para acionamentos que implicam um número elevado de partidas ou inversões, também o torque máximo de emprego deve ser limitado de forma adequada em relação à resistência das engrenagens ou dos eixos.

Torque nominal T_N [Nm]

É o torque convencional que caracteriza o tamanho do redutor.

Encontra correspondência com o torque de limite conforme a ISO (D.P. 6336) da maior relação de cada tamanho.

Potência de saída P_2 [kW]

Combinação do valor de torque relativo a uma duração de 10000 horas à velocidade de saída respectiva do redutor. Para as versões angulares, os valores mencionados anteriormente fazem referência a uma versão com entrada universal. Nos casos em que o valor da potência nominal na aplicação considerada ultrapasse o valor da potência térmica do redutor em questão, será necessário prever um circuito auxiliar apropriado de arrefecimento do óleo.

Potência térmica P_T [kW]

Potência que pode ser transmitida de maneira contínua pelo redutor em determinadas condições de funcionamento em relação às temperaturas máximas admissíveis para o redutor. Consultar o capítulo: Potência térmica.

Velocidade de entrada n_1 [min^{-1}]

Os valores de velocidade de entrada indicados no catálogo são três para cobrir a maior parte das aplicações do setor industrial.

3. FATTORE DI SERVIZIO

Fattore di applicazione K_A

Il fattore di applicazione viene definito dal tipo di motore primo e dal tipo di macchina azionata dal riduttore. Si tratta di un valore empirico stabilito dalle norme attraverso l'esperienza storica delle diverse applicazioni e tiene conto delle variazioni di carico, degli urti della trasmissione e della incertezza relativa alla variazione dei parametri che concorrono alla trasmissione della potenza.

L'importanza della macchina azionata è fondamentale nella individuazione del fattore K_A in quanto i motori utilizzati in combinazione con i riduttori sono normalmente elettrici oppure idraulici e quindi classificati come motorizzazioni ad azionamento uniforme.

Deve essere moltiplicato per la coppia (o la potenza) nominale di funzionamento per ottenere la coppia (o la potenza) di riferimento da confrontare con il valore a catalogo.

Nel caso di motori primi diversi da quelli indicati o nel caso si debbano calcolare durate diverse dalle 10000 ore previste, preghiamo consultare il referente DANA di zona.

La tabella seguente riporta alcuni valori del fattore di applicazione.

3. SERVICE FACTOR

Application factor K_A

The application factor is defined by the type of prime mover and the type of machine driven by the gear unit. This is an empirical value fixed by the standards through the historic experience of the various applications and takes into account the variations of load, transmission impacts and uncertainty relative to the variation of parameters involved in the transmission of power.

The importance of the machine driven is essential in identifying the K_A factor, since the motors used in combination with the gear units are normally electric or hydraulic and therefore classed as uniform drive motorizations.

It must be multiplied by the nominal operating torque (or power) in order to obtain the reference torque (or power) to be compared with the catalogue value.

With prime movers different from those indicated or in the event durations other than the foreseen 10000 hours are to be calculated, please consult the DANA area contact person.

The following table gives several application factor values.

3. BETRIEBSFAKTOR

Anwendungsfaktor K_A

Der Anwendungsfaktor hängt vom Typ des Primärmotors und der Art der vom Getriebe angetriebenen Maschine ab. Es handelt sich um einen empirischen Wert, der auf den für die verschiedenen Anwendungen durch Erfahrung festgelegte Normen beruht und der die Laständerungen, die Übertragungswucht und die Ungewissheit der Parameteränderung bei der Leistungsübertragung einbezieht. Die angetriebene Maschine ist bei der Festlegung des Faktors K_A von grundlegender Bedeutung, da es sich bei den mit den Getrieben eingesetzten Motoren meist um Elektro- oder Hydraulikmotoren handelt, die als gleichförmige Antriebsmotoren klassifiziert sind.

Er muss mit dem Nennbetriebsdrehmoment (oder der Nennleistung) multipliziert werden, um das Bezugsdrehmoment (oder die Bezugtleistung) für den Vergleich mit dem Katalogwert zu erhalten.

Bei anderen als den angegebenen Primärmotoren oder bei von 10000 Stunden abweichender Dauer bitten wir Sie, sich an die DANA Kontakterson der zone zu wenden.

Die folgende Tabelle enthält einige Werte des Anwendungsfaktors.

3. FACTEUR DE SERVICE

Facteur d'application K_A

Le facteur d'application est défini par le type de moteur primaire et par le type de machine menée. Il s'agit d'une valeur empirique fixée par les normes par le biais de l'historique des différentes applications et tient compte des variations de charge, des chocs de la transmission et l'incertitude relative à la variation des paramètres qui participent à la transmission de la puissance.

L'importance de la machine menée est fondamentale pour la détermination du facteur K_A dans la mesure où les moteurs utilisés en combinaison avec les réducteurs sont normalement électriques ou hydrauliques et donc classés comme motorisations à entraînement uniforme. Elle doit être multipliée par le couple (ou la puissance) nominale de fonctionnement pour obtenir le couple (ou la puissance) de référence à comparer avec la valeur du catalogue.

Dans le cas de moteurs primaires différents de ceux indiqués ou dans le cas de calcul de durées différentes des 10000 heures prévues, veuillez consulter la personne de référence de la zone DANA.

Le tableau suivant donne quelques valeurs du facteur d'application.

3. FACTOR DE SERVICIO

Factor de aplicación K_A

El factor de aplicación está definido por el tipo de motor principal y el tipo de máquina accionado por el reductor. Es un valor empírico que refleja las experiencias realizadas con numerosas aplicaciones. Toma en cuenta las variaciones de carga, los choques de la transmisión y la incertidumbre acerca de cómo varían los parámetros involucrados en la transmisión de potencia.

El tipo de máquina accionada es fundamental para determinar el factor K_A , ya que los motores que se combinan con reductores son normalmente eléctricos o hidráulicos y se considera que el accionamiento es uniforme.

El factor de aplicación se multiplica por el par (o por la potencia) nominal de funcionamiento para obtener un par (o una potencia) de referencia que se compara con el valor del catálogo.

Si los motores principales son diferentes de los indicados o la duración prevista no es 10000 horas, por favor consulte a la persona de contacto del área de DANA. La tabla indica algunos valores para el factor de aplicación.

3. FATOR DE SERVIÇO

Fator de aplicação K_A

O fator de aplicação é definido pelo tipo de máquina motriz e pelo tipo de máquina acionada pelo redutor. Trata-se de um valor empírico estabelecido pelas normas através da experiência histórica das diversas aplicações e leva em consideração as variações de carga, os impactos da transmissão e a incerteza relativas à variação dos parâmetros que concordam para a transmissão da potência. A importância da máquina acionada é fundamental na determinação do fator K_A , porque os motores utilizados em combinação com os redutores normalmente são elétricos ou hidráulicos e, portanto, são classificados como motorizações com acionamento uniforme. Deve ser multiplicado pelo torque (ou a potência) nominal de funcionamento para obter o torque (ou a potência) de referência a ser comparado com o valor do catálogo.

No caso de máquinas motrizes diferentes das aquelas indicadas ou caso seja necessário calcular durações diferentes das 10000 horas previstas, por favor consulte o contato local da DANA.

A tabela a seguir indica alguns valores do fator de aplicação.

Facteur Cs

Facteur tenant compte du nombre de démarriages dans l'unité de temps.

| Cs | Démarrages par heure / Arranques por hora / Partidas horárias | | | |
|----|---|------|--------|---------|
| | 1-5 | 6-25 | 26-100 | 101-200 |
| | 1 | 1.05 | 1.15 | 1.25 |

Température [°C]

La température de fonctionnement idéale est comprise entre 50 °C et 70 °C. Pour de courtes périodes de fonctionnement, il est possible d'atteindre une température de 80 °C. Le meilleur système pour surveiller la température est celui d'adopter un système auxiliaire d'échange thermique. Pour des températures ambiantes très basses, inférieures à -15 °C par exemple, ou de fonctionnement supérieures à 80 °C, il est nécessaire d'utiliser des huiles appropriées, ainsi que des joints et matériaux spéciaux qui peuvent être fournis sur demande.

Nous vous recommandons de consulter la personne de référence de la zone DANA. Voir chapitre: Graissage.

Factor Cs

Este factor toma en cuenta el número de arranques por unidad de tiempo.

Temperatura [°C]

La temperatura de funcionamiento ideal está entre 50 y 70 °C. Por períodos breves se puede llegar a 80 °C. El mejor método para regular la temperatura es instalar un sistema auxiliar de intercambio térmico.

Si la temperatura ambiente está por debajo de -15 °C o la temperatura de funcionamiento sobrepasa los 80 °C es preciso utilizar aceites, guarniciones y materiales especiales que DANA suministra bajo pedido. Le recomendamos que consulte a la persona de contacto del área de DANA.

Véase el capítulo: Lubricación.

Fator Cs

Fator que considera o número de partidas na unidade de tempo.

Temperatura [°C]

A temperatura de funcionamento ideal está compreendida entre 50 °C e 70 °C. Por períodos curtos é possível atingir 80 °C. O melhor sistema para manter a temperatura sob controle é recorrer a um sistema auxiliar de troca térmica.

Para temperaturas ambientais muito baixas, inferiores a -15 °C, ou temperaturas de funcionamento superiores a 80 °C, são necessários óleos adequados, junto com guarnições e materiais especiais que podem ser fornecidos a pedido. Recomendamos que você consulte seu contato local da DANA.

Consultar o capítulo: Lubrificação.

4. CHARGES RADIALES ET AXIALES

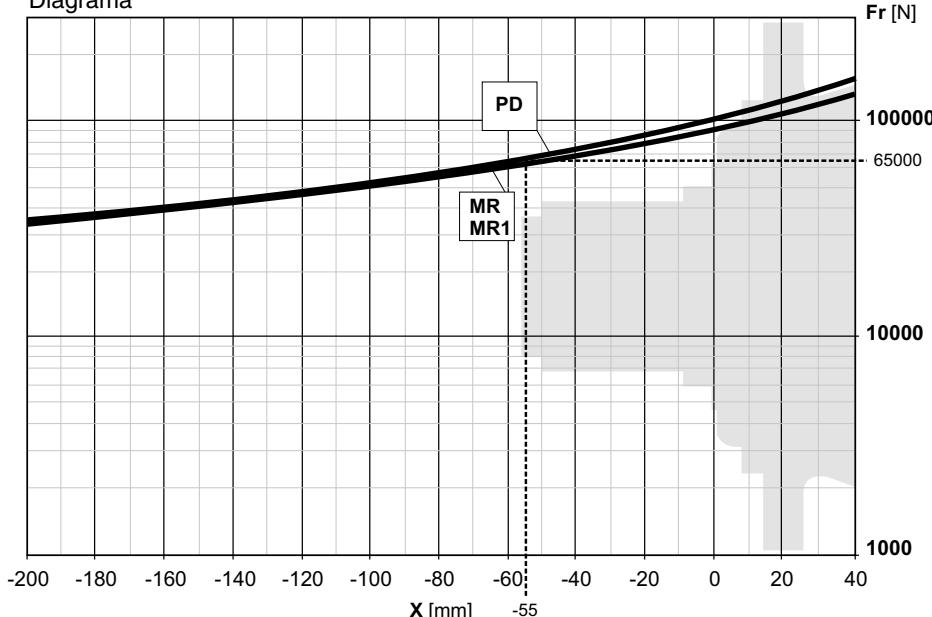

Charges sur les arbres en sortie / entrée Fr [N]

Sur le catalogue, pour chaque grandeur de réducteur, sont reportés les diagrammes des charges radiales Fr admissibles sur les arbres de sortie référencés à $n_2 \times h = 10^5$ des roulements. Pour des durées différentes, les charges devront être multipliées par le coefficient C (que l'on peut tirer du diagramme 2) qui ne doit pas dépasser la valeur de 1,5, et ce indépendamment de la durée.

Exemple:

Diagramme
Diagrama
Diagramma

1

4. CARGAS RADIALES Y AXIALES

Cargas sobre los ejes de salida / entrada Fr [N]

Para cada tamaño de redutor el catálogo trae los diagramas de las cargas radiales Fr admitidas en los ejes de salida para $n_2 \times h = 10^5$ de los cojinetes. Si la duración es diferente, las cargas se deben multiplicar por el coeficiente C (tomándolo del diagrama 2). De todas maneras, independientemente de la duración, C no puede ser mayor que 1.5.

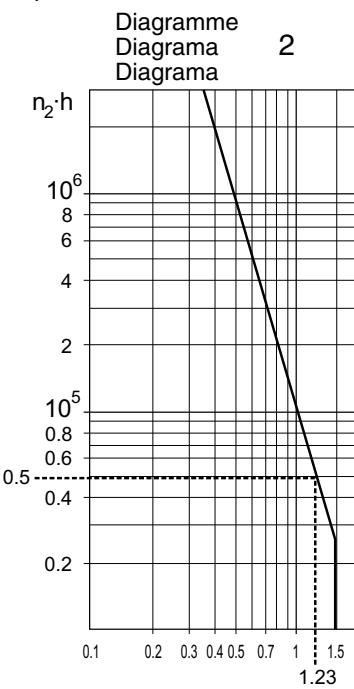

Ejemplo:

4. CARGAS RADIAIS E AXIAIS

Cargas nos eixos de saída/entrada Fr [N]

Para cada tamanho de redutor são indicados no catálogo os diagramas das cargas radiais Fr admisíveis nos eixos de saída referidos a $n_2 \times h = 10^5$ dos coxins. Para durações diferentes, as cargas deverão ser multiplicadas pelo coeficiente C (obtido no diagrama 2), o qual não deverá ultrapassar o valor de 1.5, independentemente da duração.

Exemplo:

Dati:
 Riduttore ED2065 MR
 Carico radiale applicato F = 80 kN
 Posizione del carico X = - 55 mm
 Giri uscita n₂ = 20 min⁻¹

Con i quali calcoliamo:

Carico radiale ammissibile
 Fr = 65 kN (vedi diagramma 1)

$$c = \frac{F}{Fr} = 1.23 \quad (\text{vedi diagramma 2})$$

$$1.23 < 1.5 = C_{max}$$

$$\text{Durata cuscinetti } n_2 \cdot h = 0.5 \cdot 10^5$$

$$\frac{0.5 \cdot 10^5}{n_2} = 2500 \text{ ore}$$

In presenza di carico assiale, si consiglia di contattare il referente DANA di zona. Per gli alberi in ingresso vedere le rispettive tabelle. I riduttori con uscita albero femmina (FE - FS) sono impiegati normalmente per la trasmissione di sola coppia e non sono adatti a sopportare nessun carico radiale. Per eventuali informazioni consultare il referente DANA di zona.

Data:
 Gear unit size ED2065 MR
 Radial load F = 80 kN
 Load position X = - 55 mm
 Output speed n₂ = 20 min⁻¹

To be calculated:

Radial load capacity
 Fr = 65 kN (as per diagram 1)

$$c = \frac{F}{Fr} = 1.23 \quad (\text{as per diagram 2})$$

$$1.23 < 1.5 = C_{max}$$

$$\text{Bearing life } n_2 \cdot h = 0.5 \cdot 10^5$$

$$\frac{0.5 \cdot 10^5}{n_2} = 2500 \text{ hours}$$

In the event of axial load, it is advisable to consult the DANA area contact person. For input shafts, see the respective tables. Gear units with female shaft output are used for the transmission of torque only, and are unsuitable for supporting any radial load. For information consult the DANA area contact person.

Daten:
 Getriebe ED2065 MR
 Angelegte Radiallast F = 80 kN
 Laststellung X = - 55 mm
 Abtriebsdrehzahl n₂ = 20 min⁻¹

Berechnung:

Zulässige Radiallast
 Fr = 65 kN (siehe Diagramm 1)

$$c = \frac{F}{Fr} = 1.23 \quad (\text{siehe Diagramm 2})$$

$$1.23 < 1.5 = C_{max}$$

$$\text{Lagerlebensdauer } n_2 \cdot h = 0.5 \cdot 10^5$$

$$\frac{0.5 \cdot 10^5}{n_2} = 2500 \text{ Stunden}$$

Sollten Axiallasten anliegen, wir empfehlen Ihnen, Sich an die DANA Kontaktperson der zone zu wenden. Für Antriebswellen siehe die betreffenden Tabellen. Die Getriebe mit Hohlwellenabtrieb (FE - FS) werden normalerweise nur für die Übertragung des Drehmoments eingesetzt und sind absolut ungeeignet für Radiallasten. Für weitere Informationen, Wir empfehlen Ihnen, Sich an die DANA Kontakterson der zone zu wenden.

Carichi sugli alberi di uscita versione FS

Nel montaggio di tipo pendolare si possono generare forze dovute a tre diverse cause:

- A - forza di reazione dovuta all'ancoraggio
- B - forza peso prodotta da riduttore e motore (di solito ininfluente)
- C - eventuale presenza di un tiro cinghia.

Ognuno dei succitati carichi dà origine ad un momento flettente; la risultante vettoriale di tali momenti influisce su:

- durata cuscinetti
- resistenza dell'albero
- efficacia del serraggio mediante giunto.

Nel caso in cui la condizione di carico B assuma una certa rilevanza (p.es. riduttori a due stadi azionati da grossi motori elettrici) e/o si presenti la condizione C, come qualora siano presenti carichi assiali, si raccomanda di consultare il referente DANA di zona.

Per quanto riguarda i carichi dovuti alla sola reazione, condizione A, nelle tabelle dimensionali sono state riportate le lunghezze minime L_{1min} dei bracci di reazione tali da consentire sia la durata ISO L₁₀ dei cuscinetti n₂ · h > 10⁶, che la resistenza dell'albero e l'efficacia del serraggio.

Loads on output shafts FS version

The torque arm mounting is normally accompanied by three types of forces:

- A - reaction force given by the anchoring
- B - weight of gearbox and motor (usually negligible)
- C - belt-tension force, in case of belt and pulley drive at gear unit input.

Each one of such loading conditions generates a bending moment.

The vector resultant of these moments affects:

- bearing life
- shaft fatigue resistance
- efficiency of the shafts shrink fit.

In case load condition B becomes relevant (for instance 2 stages gearbox driven by large electric motors) and/or in presence of load condition C as well when there are axial loads it is recommended to consult the DANA area contact person.

Concerning the load due to the reaction force, condition A, the minimum torque arm lengths, L_{1min}, have been tabulated in correspondence to the dimensional sheets. Such lengths grant an ISO L₁₀ bearings life n₂ · h > 10⁶ as well as shaft resistance under fatigue and efficiency of the shrink fit.

Belastungen auf den Abtriebswellen Version FS

Bei Aufsteckgetrieben können Kräfte erzeugt werden, die auf drei unterschiedlichen Ursachen beruhen:

- A - Reaktionskraft infolge der Verankerung
- B - Gewicht von Getriebe und Motor (kann in der Regel vernachlässigt werden)
- C - Riemenzugkraft, falls auf der Eingangsseite ein Riemenantrieb vorhanden ist.

Jede dieser drei Belastungen erzeugt ein Biegemoment. Das Vektorprodukt wirkt sich aus auf:

- Lebensdauer der Lager
- Festigkeit der Welle
- Wirksamkeit der Schrumpfpassung der Welle.

Falls der Lastfall B eine gewisse Bedeutung erhält (Bsp.: zweistufige Getriebe, die durch große Elektromotoren betätigt werden) und/oder der Lastfall C eintritt, wir empfehlen Ihnen, Sich an die DANA Kontakterson der zone zu wenden.

Was Beanspruchungen betrifft, die lediglich auf Lastfall A, also der Reaktionskraft beruhen, stehen in den Dimensionstabellen die Mindestlängen L_{1min} der Drehmomentstützen, die sowohl die Lebensdauer ISO L₁₀ der Lager n₂ · h > 10⁶ als auch die Festigkeit der Welle und die Wirksamkeit der Schrumpfpassung geben.

Données :
 Réducteur ED2065 MR
 Charge radiale appliquée F = 80 kN
 Position de la charge X = - 55 mm
 Vitesse de rotation en sortie n₂ = 20 min⁻¹

Pour calculer :

Charge radiale admissible
 Fr = 65 kN (voir diagramme 1)

$$c = \frac{F}{Fr} = 1.23 \quad (\text{voir diagramme 2})$$

$$1.23 < 1,5 = C_{\max}$$

$$\text{Durée des roulements } n_2 \cdot h = 0.5 \cdot 10^5$$

$$\frac{0.5 \cdot 10^5}{n_2} = 2500 \text{ heures}$$

En présence d'une charge axiale, Nous vous recommandons de consulter la personne de référence de la zone DANA. Pour les arbres en entrée, consulter les tableaux correspondants.

Les réducteurs avec sortie à arbre femelle (FE - FS) sont normalement utilisés pour la transmission du couple uniquement et ne sont pas adaptés à supporter des charges radiales.

Pour plus amples informations, veuillez consulter la personne de référence de la zone DANA.

Charges sur les arbres de sortie version FS

Dans l'application de type pendulaire trois conditions différentes de charge peuvent se vérifier:

- A - force de réaction due à l'ancrage
- B - force-poids produite par le réducteur et le moteur (en général sans influence)
- C - présence éventuelle d'une traction de la courroie.

Chacune de ces conditions de charge produit un moment de flexion.

La résultante vectorielle de ces moments a une influence sur:

- la durée de vie des roulements
- la résistance de l'arbre
- l'efficacité du serrage de l'accouplement

Si la charge B est d'une certaine importance (par ex. réducteurs à deux étages actionnés par de gros moteurs électriques) ou en présence de la condition C, mais encore en présence de charges axiales, nous vous recommandons de consulter la personne de référence de la zone DANA.

En ce qui concerne les charges dues seulement à la réaction (condition A), dans les tableaux des dimensions sont reportées les longueurs minimales L_{1min} des bras de réaction aptes à garantir tant la durée ISO L₁₀ des roulements n₂ · h > 10⁶ que la résistance de l'arbre et l'efficacité du serrage.

Datos:
 Reductor ED2065 MR
 Carga radial aplicada F = 80 kN
 Posición de la carga X = - 55 mm
 Velocidad de salida n₂ = 20 min⁻¹

Sirven para calcular:

Carga radial admisible
 Fr = 65 kN (véase el diagrama 1)

$$c = \frac{F}{Fr} = 1.23 \quad (\text{véase el diagrama 2})$$

$$1.23 < 1.5 = C_{\max}$$

$$\text{Duración de los rodamientos } n_2 \cdot h = 0.5 \cdot 10^5$$

$$\frac{0.5 \cdot 10^5}{n_2} = 2500 \text{ horas}$$

Si la carga es axial, le recomendamos que consulte a la persona de contacto del área de DANA.

Los ejes de entrada se encuentran en las tablas correspondientes.

Los reductores con salida hembra (FE - FS) se emplean generalmente para transmitir sólo el par y no admiten cargas radiales.

Le recomendamos que consulte a la persona de contacto del área de DANA.

Dados:
 Redutor ED2065 MR
 Carga radial aplicada F = 80 kN
 Posição da carga X = - 55 mm
 Rotação na saída n₂ = 20 min⁻¹

Com os quais calculamos:

Carga radial admissível
 Fr = 65 kN (ver o diagrama 1)

$$c = \frac{F}{Fr} = 1.23 \quad (\text{ver o diagrama 2})$$

$$1.23 < 1,5 = C_{\max}$$

$$\text{Duração dos coxins } n_2 \cdot h = 0.5 \cdot 10^5$$

$$\frac{0.5 \cdot 10^5}{n_2} = 2500 \text{ horas}$$

Em presença de carga axial, recomendamos que você consulte seu contato local da DANA.

Para os eixos de entrada, ver as respectivas tabelas. Os redutores com saída de eixo fêmea (FE - FS) são empregados normalmente para a transmissão exclusiva de torque e não são adequados a suportar nenhuma carga radial.

Para obter informações eventuais, recomendamos que você consulte seu contato local da DANA.

Carga sobre los ejes en salida Versión FS

En el montaje del tipo pendular se pueden generar fuerzas debidas a varias causas:

- A - la fuerza de reacción debida al anclaje
- B - la fuerza del peso producida por el reductor y el motor (que normalmente no influye)
- C - la posible presencia de un tirón de correa.

Cada una de las cargas mencionadas da lugar a un momento de flexión; el resultado vectorial de tales momentos influye sobre:

- duración de los cojinetes
- resistencia del eje
- eficacia de la fijación mediante la unión.

En el caso en que las condiciones de carga B asumieran cierta importancia (por ej. reductores de dos etapas accionados por grandes motores eléctricos) o que se presentara la condición C, al igual que con las cargas coaxiales, le recomendamos que consulte a la persona de contacto del área de DANA.

Por lo que respecta a las cargas debidas por la mera reacción, condición A, en las tablas de dimensiones se encuentran indicadas las larguras mínimas de los brazos de reacción, L_{1min}, de manera que se consienta tanto la duración ISO L₁₀ de los cojinetes n₂ · h > 10⁶, como la resistencia del eje y la eficacia de la fijación.

Cargas nos eixos de saída versão FS

Na montagem de tipo pendular podemos gerar forças devido a três causas diferentes:

- A - força de reação devido à ancoragem
- B - força do peso produzida por redutor e motor (geralmente não influente)
- C - eventual presença de uma tensão da correia

Cada uma das acima citadas cargas origina um momento de flexão; a resultante vetorial destes momentos influencia na:

- duração dos rolamentos
- resistência do eixo
- eficácia do aperto mediante disco.

No caso em que a condição de carga B assumir uma certa relevância (por ex.: redutores com dois estágios acionados por grandes motores elétricos) e/ou se apresentar a condição C, como também no caso em que se apresentarem cargas axiais, recomendamos que você consulte seu contato local da DANA.

Em relação às cargas devido só à reação, condição A, nas tabelas dimensionais foram indicados os comprimentos mínimos L_{1min} dos braços de reação que correspondem tanto à duração ISO L₁₀ dos rolamentos n₂ · h > 10⁶, quanto à resistência da árvore e à eficácia do aperto.

Tali valori sono riferiti ai dati di coppia limite e alla posizione di ancoraggio del braccio di reazione definita dalla quota L₅ (riportata nelle tavole dimensionali).

Nel calcolo delle lunghezze minime dei bracci di reazione non si è tenuto conto della presenza di eventuali carichi assiali.

Qualora si verificasse che:

The tabulated L_{1min} are referred to the limit torques as well as to the anchoring position of the torque arm. Such position is defined by measure L₅ (stated on the dimensional sheets). When calculating L_{1min} no axial load has been considered.

In case of an axial load:

$$F_a > \frac{0.1 T_{2lim}}{L_{1min}}$$

consultare il referente DANA di zona.

consult the DANA area contact person.

Diese Werte beziehen sich auf die Tabellendaten des Grenzdrehmoments und die Verankerungsposition der Drehmomentstütze, die durch den Wert L₅ gegeben ist (steht in den Dimensionstabellen).

Bei der Berechnung der Mindestlängen der Drehmomentstützen wurde das Vorliegen eventueller Axialbeanspruchungen nicht berücksichtigt.

Falls:

AVVERTENZA

Onde non generare carichi anomali sugli alberi, tali da compromettere la resistenza a fatica, si raccomanda di realizzare un ancoraggio del giunto braccio di reazione libero secondo l'asse dell'albero.

Si raccomanda inoltre che il vincolo tangenziale venga ammortizzato mediante elementi in gomma e/o ammortizzatori.

Tenere conto che il senso secondo cui agisce la forza di reazione, A, dipende dal senso di rotazione dell'albero di uscita.

Verificare sempre che il giunto di serraggio sia in grado di trasmettere la coppia massima prevista per la specifica applicazione.

WARNING

We strongly recommend that the anchoring point of the torque arm is allowed to float axially to avoid the possibility of any additional side load on the output shaft, which may create excessive stresses. The torque arm should incorporate a flexible element in the tangential direction to reduce shock loads.

Take into account that the way of the reaction force, A, depends on the direction of rotation of the output shaft.

Remember always to check the shrink disc coupling can transmit the max. torque for each specific application.

Sich an die DANA Kontaktperson der zone zu wenden.

ACHTUNG

Um eine zusätzliche Belastung auf den Abtriebswellen zu vermeiden, die zur Überschreitung der Ermüdungsgrenze führen könnte, sollte die Verankerungsstelle der Drehmomentstütze unbedingt so beschaffen sein, daß diese sich in der Längsrichtung der Welle frei bewegen kann.

Die Drehmomentstütze sollte in der Tangentialrichtung mit Gummielementen und/oder Stoßdämpfern versehen werden, um die Stoßbelastungen zu verringern.

Auch berücksichtigen, daß die Richtung, in der die Reaktionskraft A wirkt, von der Drehrichtung der Abtriebswelle abhängt. Immer sicherstellen, daß die Schrumpfscheibe in der Lage ist, das für die spezifische Anwendung vorgesehene Höchstdrehmoment zu übertragen.

Verifica dell'accoppiamento mediante giunto di serraggio

1. Impiego del secondo centraggio Za.

a) Si deve utilizzare il secondo centraggio (avente diametro Za) quando non è verificata la seguente relazione:

$$X3 > 0,5 D_3$$

Za = diametro dell'albero condotto (vedi tab. a pag. 26)

X3 = parte di albero interessata al serraggio

b) Nel caso venga utilizzato il secondo centraggio è opportuno che l'albero maschio porti una boccola di bronzo o simile per evitare corrosioni che rendono difficoltoso lo smontaggio. (N.B.: questa zona non deve essere lubrificata)

2. Lunghezza utile di accoppiamento

X3. La parte di albero femmina interessata all'accoppiamento deve soddisfare la seguente relazione:

$$X3 < 1.1 \cdot I$$

I = lunghezza del cono del giunto.

Nel caso questo non venga rispettato, si avranno difficoltà di smontaggio.

(N.B.: questa zona NON deve essere lubrificata).

Clamping capacity of the shrink disc

1. When to use the second pilot Za.

a) Additional pilot (dia. Za) should be used in cases where the following conditions is not met:

$$X3 > 0,5 D_3$$

Za = driven shaft dia. (see table on pag. 26)

X3 = driven shaft clamping length

b) When the second pilot is used, it is better to fit a bronze bush on the corresponding mating part of the male shaft. This to prevent corrosion which would make demounting difficult. (This area should not be lubricated)

2. Clamping length X3.

The clamping length of gearbox hollow shaft shall must comply with the following condition:

$$X3 < 1.1 \cdot I$$

I = length of shrink disc cone.

This is to avoid demounting problems. (This area should not be lubricated)

Prüfung der Schrumpfscheiben-Ausführung

1. Verwendung der zweiten Zentrierung Za.

a) Die zweite Zentrierung (mit Durchmesser Za) muß dann verwendet werden, wenn die folgende Bedingung nicht vorliegt:

$$X3 > 0,5 D_3$$

wobei Za = Durchmesser der Abtriebswelle (vgl. Tabelle auf Seite 26) und

X3 = Länge der Welle in der Schrumpfpassung ist.

b) Wenn die zweite Zentrierung verwendet wird, sollte die Vollwelle mit Bronzebuchse oder ähnlichem versehen sein, damit Korrosionserscheinungen vermieden werden, die beim Auseinandernehmen Schwierigkeiten bereiten könnten (Anm.: Dieser Bereich darf nicht geschmiert werden).

2. Nützliche Schrumpflänge X3.

Der Teil der hohlen Zylinderwelle, der in der Schrumpfscheibe sitzt, muß der folgenden Beziehung gerecht werden:

$$X3 < 1.1 \cdot I$$

wobei I = Länge des Schrumpfscheibenkonus. Wenn diese Bedingung nicht eingehalten wird, ergeben sich Schwierigkeiten beim Auseinandernehmen.

(Anm.: Dieser Bereich darf NICHT geschmiert werden.)

Ces valeurs se réfèrent aux données de couple limite et à la position d'ancrage du bras de réaction définie par la cote L₅ (indiquée dans les tableaux des dimensions).

Dans le calcul des longueurs minimales des bras de réaction il n'a pas été tenu compte de la présence éventuelle de charges axiales.

Au cas où se vérifierait la condition:

consulter la personne de référence de la zone DANA.

IMPORTANT

Afin de ne pas générer des charges anormales sur les arbres qui pourraient compromettre la résistance à la fatigue, il est recommandé de réaliser un accouplement libre suivant l'axe de l'arbre. Il est également recommandé d'amortir la force tangentielle par Silentblocs en caoutchouc ou des amortisseurs.

Ne pas oublier que le sens de la force de réaction, A, dépend du sens de rotation de l'arbre de sortie.

Vérifier toujours que l'accouplement est en mesure de transmettre le couple maximum prévue pour l'application.

Dichos valores se refieren a los datos del par límite y a la posición de anclaje del brazo de reacción definida como cota L₅ (indicada en las tablas de dimensiones). Para el cálculo de las larguras mínimas de los brazos de reacción, no se ha tenido en cuenta la presencia de cargas coaxiales.

En el caso en que se verificase:

$$F_a > \frac{0.1 T_{2\text{lim}}}{L_{1\text{min}}}$$

consulte a la persona de contacto del área de DANA.

Estes valores referem-se aos dados de torque limite reação definida da cota L₅ (indicada nas tabelas dimensionais).

No cálculo dos comprimentos mínimos dos braços de reação não foi considerada a presença de eventuais cargas axiais.

Ao se verificar que:

consulte seu contato local da DANA.

AVISO

Para não gerar cargas anormais nos eixos, que comprometam a resistência por fadiga, recomenda-se realizar a ancoragem do braço de reação livre no sentido axial do eixo. Recomenda-se também que o vínculo tangencial seja amortecido com elementos de borracha e/ou amortecedores. Lembre-se que o sentido no qual atua a força de reação A, depende do sentido de giro do eixo de saída.

Verificar sempre que o disco de contração seja capaz de transmitir o torque máximo previsto para a específica aplicação.

Vérification de l'accouplement par disque de serrage

1.Utilisation du deuxième centrage Za.

a) Le deuxième centrage (ayant un diamètre Za) doit être utilisé quand la formule suivante ne se vérifie pas:

X3 > 0,5 D₃
Za = diamètre de l'arbre mené (voir tab. page 27)

X3 = partie de l'arbre intéressée par le serrage

b) Si on utilise le deuxième centrage, il faut que l'arbre mâle porte une bague en bronze ou similaire pour éviter les corrosions rendant le démontage difficile.

(N.B.: cette zone ne doit pas être lubrifiée)

2.Longueur utile d'accouplement X3.

La partie d'arbre femelle intéressée par l'accouplement doit satisfaire la formule suivante:

X3 < 1.1 · I

I = longueur du cône de l'accouplement
Si cela ne se vérifie pas, le démontage sera difficile.

(N.B.: cette zone ne doit pas être lubrifiée)

Verificación del acoplamiento mediante anillo de contracción

1.Utilización del segundo centrado Za.

a) El centrado adicional (con diámetro Za), se utiliza cuando no se verifique la siguiente relación:

X3 > 0,5 D₃
Za = diámetro del árbol guiado. (Ver tabla de la pág. 27)

X3 = parte del árbol comprendida en la fijación

b) En el caso en que se utilice el centrado adicional, es oportuno que el árbol macho lleve un casquillo de bronce o similares, para evitar posibles corrosiones que complicarían el desmontaje.

(N.B.: esta zona no tiene que estar lubricada).

2.Largura útil de acoplamiento X3. La parte hembra del eje comprendida en el acoplamiento, tiene que satisfacer las siguientes relaciones:

X3 < 1.1 · I

I = anchura del cono de la unión.
Si esto no se respete, se encontrarán dificultades a la hora de desmontar.
(N.B.: esta zona NO tiene que estar lubricada)

Verificação do acoplamento mediante disco de contração

1.Emprego da segunda centragem Za.

a) Deve-se utilizar a segunda centragem (com diâmetro Za) quando não se verificar a seguinte relação:

X3 > 0,5 D₃
Za = diâmetro do eixo conduzida (vide tab. na pág. 27)

X3 = parte interessada do eixo destinado

b) Será utilizada a segunda centragem é conveniente montar no eixo macho uma bucha de bronze ou similar para evitar corrosões que dificultem a desmontagem.

(N.B.: esta zona não deve ser lubrificada)

2.Comprimento útil de acoplamento X3. A parte de eixo fêmea interessada ao acoplamento deve satisfazer a seguinte relação:

X3 < 1.1 · I

I = comprimento do cone do disco.
Se este não for respeitado, ocorrerá dificuldades na desmontagem.
(N.B.: esta zona NÃO deve ser lubrificada).

3. Coppia trasmissibile T_2 . I valori di coppia trasmissibile mediante il giunto di serraggio vengono definiti dal costruttore del giunto di serraggio stesso. Normalmente le tolleranze raccomandate nell'accoppiamento tra i due alberi per una corretta trasmissione della coppia sono H7-h6

4. Carico assiale F_a . La forza di attrito che permette la trasmissione della coppia è evidentemente la stessa che si oppone allo sfilamento assiale del riduttore, pertanto:

3. Transmissible torque T_2 . The values of transmissible torques are stated by the shrink disc manufacturer. Normally the tolerances of the mating shafts granting proper torque transmission are: H7-h6

4. Axial load F_a . The friction resistance, which makes torque transmission possible, prevents the mating shafts from sliding axially, consequently:

3. Übertragbares Drehmoment T_2 . Die Werte des übertragbaren Drehmoments werden vom Hersteller der Schrumpfscheibe angegeben. Für eine korrekte Übertragung des Drehmoments wird für die Passung der beiden Wellen in der Regel eine Toleranz H7-h6 empfohlen.

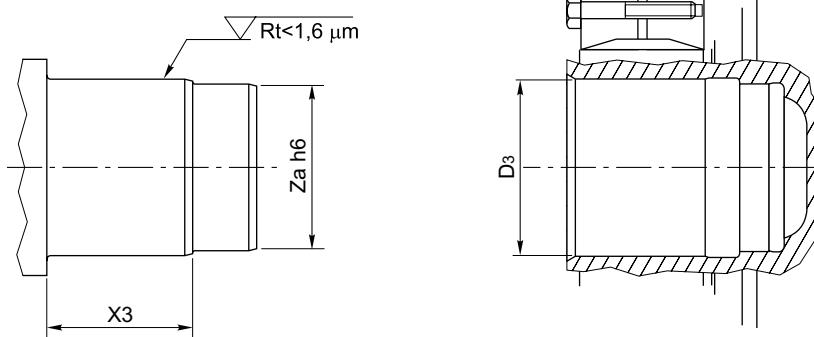

4. Axiale Belastung F_a . Die Reibungskraft, die die Übertragung des Drehmoments gestattet, ist offensichtlich die gleiche, die sich dem axialen Herausziehen des Getriebes widersetzt, d.h.:

$$F_a \text{ max} = \frac{T_2 - 2}{Za} \text{ (kN)}$$

Nel caso in cui si manifesti un carico assiale la coppia trasmissibile si riduce.

In the presence of an axial load the transmissible torque will be reduced with a vector effect.

Falls eine axiale Belastung vorliegt, reduziert sich das übertragbare Drehmoment.

5. POTENZA TERMICA P_T [kW]

Le potenze termiche dei riduttori sono indicate nelle tabelle che riassumono le prestazioni tecniche dei vari stadi di riduzione. I valori pubblicati fanno riferimento ad un impiego continuo del riduttore:

- Con lubrificazione a sbattimento
- Montato orizzontalmente
- Ad una velocità di ingresso riduttore di 1500 min⁻¹
- Per una temperatura massima dell'olio di 80 °C (olio VG150)
- Ad una temperatura ambiente di 20 °C
- Nella condizione di impiego "ambiente grande".

5. THERMAL RATING P_T [kW]

The thermal ratings of the gear units are given in the tables summarizing the technical performance of the various reduction stages.

The values given refer to a continuous use of the gear unit:

- With splash lubrication
- Horizontally mounted
- At a gear unit input speed of 1500 min⁻¹
- For a max. oil temperature of 80 °C (oil VG150)
- At an ambient temperature of 20 °C
- In the "large ambient" condition of use.

5. WÄRMELEISTUNG P_T [kW]

Die Wärmeleistungen der Getriebe sind in den Tabellen aufgeführt, die die technischen Leistungen der verschiedenen Übersetzungsstufen zusammenfassen.

Die angegebenen Daten beziehen sich auf einen kontinuierlichen Getriebeeinsatz:

- Spritzschmierung
- Horizontale Einbaulage
- Antriebsdrehzahl des Getriebes 1500 min⁻¹
- Für eine Höchsttemperatur des Öls von 80 °C (Öl VG150)
- Raumtemperatur von 20 °C
- Einsatzbedingung "großes Arbeitsumfeld".

3. Couple transmissible T_2 . Les valeurs de couple transmissible par le disque de serrage sont définies par le constructeur du disque de serrage. Normalement les tolérances recommandées dans l'accouplement entre les deux arbres pour une transmission correcte du couple sont H7-h6

4. Charge axial F_a . La force de friction qui permet la transmission du couple est bien entendu la même qui s'oppose au déboîtement axial du réducteur, donc:

3. Par transmisible T_2 . Los valores del par que se pueden transmitir mediante anillo de contracción tienen que ser definidos por el fabricante de la misma unión. Normalmente, las tolerancias recomendadas para el acoplamiento entre los dos ejes, manteniendo una transmisión correcta del par, son: H7-h6

4. Carga axial F_a . La fuerza de fricción que permite la transmisión del par es, evidentemente, la misma que se opone al deslizamiento axial del reductor y, por lo tanto:

$$F_a \text{ max} = \frac{T_2 - 2}{Za} \text{ (kN)}$$

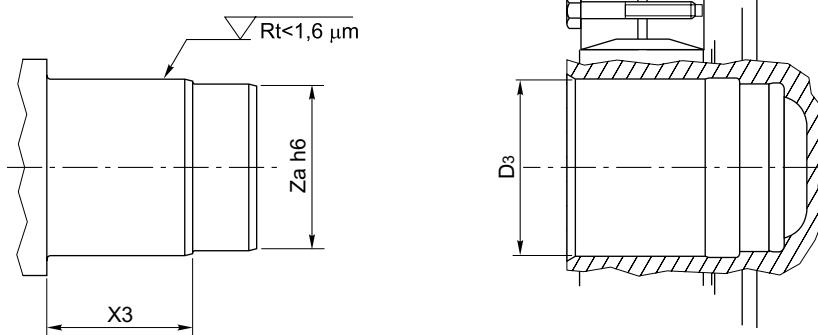

En présence d'une charge axiale, le couple transmissible diminue.

Si no se manifestara una carga axial el par transmisible se reduciría.

3. Torque transmissível T_2 . Os valores de torque transmissível mediante o disco de contração são definidos pelo próprio fabricante do disco de aperto. Geralmente as tolerâncias recomendadas no acoplamento entre os dois eixos para uma correta transmissão do torque são H7-h6

4. Carga axial F_a . A força de atrito que permite a transmissão do torque é evidentemente a mesma que se opõe ao deslizamento axial do redutor, portanto:

Em presença de uma carga axial o torque transmissível se reduz.

5. PUSSANCE THERMIQUE P_T [kW]

Les puissances thermiques des réducteurs sont indiquées dans les tableaux qui résument les performances techniques des différents étages de réduction.

Les valeurs données se réfèrent à un service continu du réducteur:

- Avec une lubrification par barbotage
- Monté horizontalement
- Avec une vitesse d'entrée du réducteur de 1500 min^{-1}
- Pour une température maximale de l'huile de 80°C (huile VG150)
- Avec une température ambiante de 20°C
- Dans la condition d'emploi "milieu ambiant grand".

5. POTENCIA TÉRMICA P_T [kW]

Las potencias térmicas de los reductores se indican en las tablas que sintetizan las prestaciones técnicas de las diferentes etapas.

Los valores se refieren a reductores para uso continuo con las siguientes características:

- Lubricación por borboteo
- Montaje horizontal
- Velocidad de entrada 1500 min^{-1}
- Temperatura máxima del aceite 80°C (aceite VG150)
- Temperatura ambiente 20°C
- Funcionamiento en un "ambiente grande"

5. POTÊNCIA TÉRMICA P_T [kW]

As potências térmicas dos redutores são indicadas nas tabelas que sintetizam o desempenho técnico dos vários estágios de redução.

Os valores publicados fazem referência a um emprego contínuo do redutor:

- Com lubrificação por agitação
- Montado horizontalmente
- A uma velocidade de entrada no redutor de 1500 min^{-1}
- Para uma temperatura máxima do óleo de 80°C (óleo VG150)
- A uma temperatura ambiente de 20°C
- Na condição de emprego "ambiente grande".

Fattore K

Nel caso di cicli di lavoro che prevedono un impiego intermittente del riduttore e/o alla presenza di una temperatura ambiente diversa da 20 °C, la potenza termica del riduttore può essere adeguata all'applicazione specifica tramite il fattore K

K Factor

With work cycles requiring an intermittent use of the gear unit and/or the presence of an ambient temperature different from 20 °C, the gear unit thermal rating can be adjusted to the specific application by means of the K factor.

K - Faktor

Bei Arbeitszyklen des Getriebes mit Aussetzbetrieb und/oder bei Raumtemperaturen, die von 20 °C abweichen, kann die Wärmeleistung des Getriebes mithilfe des K - Faktors an die spezifische Anwendung angepasst werden

K

| Ore di lavoro giornaliere Hours of work per day Arbeitsstunden pro Tag | Temperatura ambiente / Ambient temperature / Umgebungstemperatur [°C] | | | | |
|--|---|------|------|------|------|
| | 10° | 20° | 30° | 40° | 50° |
| □10 | 1.15 | 1 | 0.85 | 0.7 | 0.6 |
| 8 | 1.25 | 1.1 | 1 | 0.85 | 0.7 |
| 6 | 1.4 | 1.25 | 1.1 | 1 | 0.85 |
| 4 | 1.6 | 1.4 | 1.25 | 1.1 | 1 |
| 2 | 1.8 | 1.6 | 1.4 | 1.25 | 1.1 |

Fattore S

Nel caso in cui la velocità in ingresso sia diversa da 1500 rpm, l'adeguamento della potenza termica alla situazione specifica può avvenire tramite l'impiego del fattore S

S Factor

If the input speed is different from 1500 rpm, the thermal rating can be adjusted to the specific situation by means of the S factor

S - Faktor

Bei einer von 1500 U/min abweichenden Antriebsdrehzahl kann die Wärmeleistung der spezifischen Situation mithilfe des Faktors S angepasst werden

S

| | n ₁ [rpm] | | | |
|---|----------------------|------|------|-----|
| | 1750 | 1500 | 1000 | 500 |
| S | 0.94 | 1 | 1.05 | 1.1 |

Fattore R

Nel caso in cui il riduttore sia collocato in un ambiente ristretto oppure all'aperto, la potenza termica può essere modificata con l'ausilio del fattore R

R Factor

If the gear unit is located in a confined space or outdoors, the thermal rating can be modified with the aid of the R factor

R - Faktor

Falls das Getriebe in einer engen Umgebung oder im Freien aufgestellt ist, kann die Wärmeleistung mithilfe des Faktors R geändert werden

R

| | Ambiente piccolo Small space Kleiner Raum | Ambiente grande Large space Großer Raum | All'aperto Outdoors Im Freien |
|---|---|---|-------------------------------------|
| R | 0.70 | 1.00 | 1.35 |

Nel caso più generale la adeguata potenza termica del riduttore risulterà:

In the most general case the adequate thermal rating of the gear unit will be:

Ganz allgemein folgt die geeignete Wärmeleistung aus der folgenden Formel:

$$P_{T1} = P_T \cdot K \cdot S \cdot R$$

La potenza termica deve essere superiore alla potenza P da trasmettere in tutte le condizioni del ciclo di impiego.

Nel caso in cui la potenza termica del riduttore risulti inferiore alla potenza da trasmettere, anche solo in una condizione dell'eventuale ciclo di impiego, occorre prevedere la presenza di un circuito ausiliario di raffreddamento.

Per la selezione di tale circuiti, rimandiamo al Capitolo: Lubrificazione.

The thermal rating must be higher than the power P to be transmitted in all operating cycle conditions.

If the thermal rating of the gear unit is less than the power to be transmitted, even in just one condition of the possible operating cycle, an auxiliary cooling circuit must be provided.

For selecting the circuits, see the Chapter: Lubrication.

Unter allen Bedingungen des Arbeitszyklus muss die Wärmeleistung höher sein als die zu übertragende Leistung P.

Falls die Wärmeleistung des Getriebes niedriger als die zu übertragende Leistung ist, selbst in einer einzigen Bedingung des Zyklus, muss ein zusätzliches Kühlssystem installiert werden.

Für die Auswahl des Kühlssystems siehe Kapitel: Schmierung.

$$P < P_{T1}$$

Facteur K

Dans le cas de cycles de fonctionnement qui prévoient un service intermittent du réducteur et/ou une température ambiante différente de 20 °C, la puissance thermique du réducteur pourra être adaptée à l'application spécifique avec le facteur K

Factor K

Si el ciclo de trabajo contempla un uso intermitente del redutor o una temperatura ambiente distinta de 20 °C, la potencia térmica del redutor se puede corregir por medio del factor K

Fator K

No caso de ciclos de trabalho que prevejam um emprego intermitente do redutor e/ou na presença de uma temperatura ambiente diferente de 20 °C, a potência térmica do redutor poderá ser adequada à aplicação específica através do fator K

K

| Heures de fonctionnement par jour Horas de trabajo diarias Horas de trabalho diárias | Température ambiante / Temperatura ambiente / Temperatura ambiente [°C] | | | | |
|--|---|------|------|------|------|
| | 10° | 20° | 30° | 40° | 50° |
| □10 | 1.15 | 1 | 0.85 | 0.7 | 0.6 |
| 8 | 1.25 | 1.1 | 1 | 0.85 | 0.7 |
| 6 | 1.4 | 1.25 | 1.1 | 1 | 0.85 |
| 4 | 1.6 | 1.4 | 1.25 | 1.1 | 1 |
| 2 | 1.8 | 1.6 | 1.4 | 1.25 | 1.1 |

Facteur S

Dans les cas où la vitesse d'entrée est différente de 1 500 tr/min, l'adaptation de la puissance thermique au cas spécifique pourra se faire en utilisant le facteur S

Factor S

Si la velocidad de entrada es distinta de 1500 rpm la potencia térmica corregir por medio del factor S

Fator S

Caso a velocidade de entrada seja diferente de 1500 rpm, a adequação da potência térmica à situação específica poderá ocorrer através do emprego do fator S

S

| S | n ₁ [rpm] | | | |
|---|----------------------|------|------|-----|
| | 1750 | 1500 | 1000 | 500 |
| S | 0.94 | 1 | 1.05 | 1.1 |

Facteur R

Dans le cas où le réducteur serait placé en un milieu ambiant restreint ou à l'extérieur, la puissance thermique pourra être modifiée en appliquant le facteur R

Factor R

Si el redutor está colocado en un ambiente pequeño o a la intemperie la potencia térmica se puede corregir por medio del factor R

Fator R

Caso o redutor seja colocado em um ambiente fechado ou ao ar livre, a potência térmica poderá ser modificada com o auxílio do fator R

R

| R | Milieu ambiant petit Ambiente pequeño Ambiente pequeno | Milieu ambiant grand Ambiente grande Ambiente grande | En plein air Al aire libre Área aberta |
|---|--|--|--|
| | 0.70 | 1.00 | 1.35 |
| R | | | |

En général, la puissance thermique du réducteur sera:

En el caso más general la potencia térmica del redutor será:

No caso mais geral, a potência térmica adequada do redutor será:

$$P_{T1} = P_T \cdot K \cdot S \cdot R$$

La puissance thermique doit être supérieure à la puissance à transmettre P dans toutes les conditions du cycle de fonctionnement.

Si la puissance thermique du réducteur est inférieure à la puissance à transmettre, même en une seule condition du cycle de fonctionnement, il faudra prévoir la mise en place d'un circuit auxiliaire de refroidissement.

Pour la sélection de ce circuit, se référer au chapitre : Graissage.

La potencia térmica debe ser mayor que la que se debe transmitir P en cualquier condición del ciclo de utilización.

Cuando es menor aunque sea en una sola condición del ciclo, es preciso instalar un circuito de enfriamiento auxiliar. Antes de hacerlo conviene consultar el capítulo: Lubricación.

A potência térmica deve ser superior à potência a ser transmitida P em todas as condições do ciclo de trabalho.

Caso a potência térmica do redutor seja inferior à potência a ser transmitida, mesmo que somente em uma condição do eventual ciclo de trabalho, será necessário prever a presença de um circuito auxiliar de arrefecimento.

Para efetuar a seleção desses circuitos, consultar o Capítulo: Lubrificação.

$$P < P_{T1}$$

6. ESEMPIO SELEZIONE RIDUTTORE

Dati per la selezione

Motore primo:
Elettrico 1.5 kW a 1500 min⁻¹

Macchina azionata:
nastro trasportatore non uniformemente alimentato
Servizio: continuo 10 ore al giorno
Numero di avviamenti all'ora: 1
Coppia richiesta di funzionamento: 4900 Nm
Coppia massima all'avviamento: 9800 Nm
Velocità di rotazione: 1.85 min⁻¹
Vita richiesta per la trasmissione: 10000 h
Posizione di funzionamento: orizzontale
Temperatura ambiente: 30 °C
Ambiente di lavoro: grande.

Selezione del riduttore

Rapporto richiesto: 1500 / 1.85 = 810

Fattore di applicazione K_A : 1.25

Coppia per la selezione del riduttore:

$$T_{2R} = 5000 \times K_A \times CS = 6125 \text{ Nm}$$

Il riduttore da selezionare deve avere una $T_2 > T_{2R}$ coppia di riferimento per la selezione del riduttore.
Quindi andare a pag. 33 e dalla tabella selezionare nella colonna T_N il valore immediatamente più grande del valore ottenuto ($T_{2R}=6125$) e cioè 6400 Nm; sulla stessa riga nella colonna "Tipo" si leggerà che il riduttore idoneo sarà una grandezza 065; dalla corrispondente pag. 104 nella tabella "Dati tecnici" selezionare il rapporto "ieff" più vicino a quello richiesto di $i=810$, che sarà $i_{eff}=771.8$, quindi alla colonna corrispondente a 1500 min⁻¹ in corrispondenza del rapporto selezionato si leggerà un $T_2=7348$ Nm e di conseguenza il riduttore sarà in configurazione di "EQ4065".

La coppia massima del riduttore EQ4065 $T_{2max} = 10000 \text{ Nm} > 9500 \text{ Nm}$
La capacità termica del riduttore EQ4065 $P_T = 8 \text{ kW}$.
Causa la temperatura ambiente occorre considerare il coefficiente K per cui la capacità termica del riduttore diventa:
 $P_{T1} = 8 \times 0.85 = 6.8 \text{ kW}$

Essendo la velocità in ingresso pari a 1500 min⁻¹ il fattore S = 1

Potenza richiesta dalla applicazione:
 $P = 4900 \times 1.9 / 9550 = 0.97 \text{ kW}$
Essendo 6.8 kW > 0.97 kW non risulta essere necessario alcun sistema di raffreddamento ausiliario del riduttore.

N.B. Importante

Applicazioni che:

- richiedono valori di durata diverse dalle 10000 ore
- presentano velocità in entrata diverse da quelle indicate a catalogo
- sono caratterizzate da cicli di lavoro con carichi e velocità variabili
- prevedono la presenza di carichi assiali sull'albero in ingresso / uscita del riduttore devono essere analizzate specificatamente, tramite l'ausilio di programmi di calcolo dedicati, disponibili presso l'organizzazione di vendita di DANA.

6. EXAMPLE SELECTION GEAR UNIT

Selection data

Prime mover:
Electric 1.5 kW a 1500 min⁻¹

Machine driven:
conveyor belt not uniformly fed
Duty: continuous 10 hours a day
Number of starts per hour: 1
Required operating torque: 4900 Nm
Max. torque on start: 9800 Nm
Rotation speed: 1.85 min⁻¹
Required transmission life: 10000 h
Operating position: horizontal
Ambient temperature: 30 °C
Working site large space

Gear unit selection

Ratio required: 1500 / 1.85 = 810

Application factor K_A : 1.25

Torque for gear unit selection:

$$T_{2R} = 5000 \times K_A \times CS = 6125 \text{ Nm}$$

The gear unit to be selected must have a $T_2 > T_{2R}$ reference torque for gear unit selection.
Then go to page 33, from the table choose in column T_N the value immediately higher than the value obtained ($T_{2R}=6125$), that is 6400 Nm; in the same line of the "Type" column you can read that the right gearbox is size 065; from the corresponding page 104 in the table "Technical data" choose the "ieff" value that is nearest to the requested $i=810$: this ieff will be **771.8**.
Then from the column corresponding to 1500 min⁻¹, in correspondence to the selected ratio, you will read $T_2=7348$ Nm; therefore the correct gearbox will have a "EQ4065" configuration.

Max. torque of gear unit EQ4065

$$T_{2max} = 10000 \text{ Nm} > 9500 \text{ Nm}$$

Thermal capacity of gear unit EQ4065

$$P_T = 8 \text{ kW}$$

Due to the ambient temperature the K factor must be considered, therefore the thermal capacity of the gear unit becomes:

$$P_{T1} = 8 \times 0.85 = 6.8 \text{ kW}$$

As the input speed is equal to 1500 min⁻¹ the S factor = 1

Power required by the application:

$$P = 4900 \times 1.9 / 9550 = 0.97 \text{ kW}$$

As 6.8 kW > 0.97 kW no gear unit auxiliary cooling system is required.

NOTE Important

Applications that

- require duration values different from 10000 h
- have different input speeds from those given in the catalogue
- are characterized by work cycles with variable speeds and loads
- foresee the presence of axial loads on the gear unit input / output shaft must be examined separately, with the aid of dedicated calculation programs, available from the DANA sales organization.

6. BEISPIEL EINER GETRIEBEAUSWAHL

Auswahldaten

Primärmotor:
Elektromotor 1.5 kW bei 1500 min⁻¹

Angetriebene Maschine:
Transportband mit ungleichmäßiger Beschickung
Betrieb: kontinuierlich 10 Stundentäglich
Anzahl der Starts pro Stunde: 1
Erforderliches Betriebsdrehmoment: 4900 Nm
Maximales Anfahrdrehmoment: 9800 Nm
Drehzahl: 1.85 min⁻¹
Gewünschte Dauer: 10000 h
Einbaulage: horizontal
Umgebungstemperatur 30°C
Arbeitsumfeld groß

Getriebeauswahl

Gewünschte Übersetzung: 1500 / 1.85 = 810

Anwendungsfaktor K_A : 1.25

Drehmoment für die Getriebeauswahl:

$$T_{2R} = 5000 \times K_A \times CS = 6125 \text{ Nm}$$

Das auszuwählende Getriebe muss ein Bezugsdrehmoment von $T_2 > T_{2R}$ für die Getriebeauswahl aufweisen.
Wählen Sie in der Tabelle auf Seite 33 in Spalte T_N den unmittelbar höheren Wert nach dem zuvor errechneten Wert ($T_{2R}=6125$), d.h. 6400 Nm; in derselben Zeile können Sie in der Spalte "Typ" ablesen, dass die geeignete Getriebegröße 065 ist; wählen Sie jetzt auf Seite 104 in der Tabelle "Technische Daten" den Wert $teff$, der dem gewünschten von $i = 810$ am nächsten kommt, d.h. $ieff=771.8$; in der 1500 min⁻¹ entsprechenden Spalte können Sie auf Höhe des gewünschten Verhältnisses $T_2=7348$ Nm ablesen; die korrekte Getriebekonfiguration ist demnach "**EQ4065**".

Das maximale Drehmoment des Getriebes EQ4065

$$T_{2max} = 10000 \text{ Nm} > 9500 \text{ Nm}$$

Wärmeleistung des Getriebes EQ4065

$$P_T = 8 \text{ kW}$$

Aufgrund der Raumtemperatur muss der K - Faktor berücksichtigt werden; die Wärmeleistung des Getriebes wird demnach:

$$P_{T1} = 8 \times 0.85 = 6.8 \text{ kW}$$

Da die Antriebsdrehzahl 1500 min⁻¹ beträgt, ist der Faktor S = 1

Für die Anwendung erforderliche Leistung:

$$P = 4900 \times 1.9 / 9550 = 0.97 \text{ kW}$$

Da 6.8 kW > 0.97 kW ist kein zusätzliches Kühlssystem des Getriebes erforderlich.

Hinweis Wichtig

Anwendungen mit:

- von 10000 Betriebsstunden abweichen den Werten
- Antriebsdrehzahlen, die von den im Katalog aufgeführten Werten abweichen
- regelbaren Arbeitszyklen und Drehzahlen
- Axiallasten auf der Antriebs-/ Abtriebswelle des Getriebes müssen separat mithilfe von spezifischen Rechenprogrammen analysiert werden, die von der Vertriebsorganisation DANA bezogen werden können.

6. EXEMPLE DE SÉLECTION DU RÉDUCTEUR

Renseignements utiles pour la sélection

Moteur primaire :
Eléctrique 1,5 kW à 1500 min⁻¹

Machine menée :
bande transporteuse non uniformément alimentée
Service : continu 10 heures par jour
Nombre de démarriages par heure : 1
Couple de fonctionnement requis : 4900 Nm
Couple maximum au démarrage : 9800 Nm
Vitesse de rotation : 1.85 min⁻¹
Durée de vie requise pour la transmission : 10000 h
Position de fonctionnement : horizontale
Température ambiante 30 °C
Milieu de travail grand

Sélection du réducteur

Rapport requis: 1500 / 1,85 = 810
Facteur d'application K_A: 1,25
Couple pour la sélection du réducteur :

$$T_{2R} = 5000 \times K_A \times CS = 6125 \text{ Nm}$$

Le réducteur à sélectionner doit avoir un $T_2 > T_{2R}$ couple de référence pour la sélection du réducteur.
Donc, aller à la page 33 et sélectionner dans la colonne T_N du tableau la valeur immédiatement plus grande de la valeur obtenue ($T_{2R}=6125$), à savoir 6400 Nm; sur la même ligne dans la colonne "Type" on pourra déduire que le réducteur adapté sera de grandeur 065; dans le tableau "Caractéristiques techniques" de la page 104, sélectionner le rapport "ieff" le plus près de celui requis de $i=810$, qui sera $ieff=771.8$, donc, dans la colonne correspondant à 1500 min⁻¹ à la hauteur du rapport sélectionné, on lira un $T_2=7348$ Nm et, par conséquent, la configuration du réducteur sera "**EQ4065**".

Le couple maximum du réducteur EQ4065 $T_{2max} = 10000 \text{ Nm} > 9500 \text{ Nm}$

La capacité thermique du réducteur EQ4065 $P_T = 8 \text{ kW}$.

Il faut tenir compte du coefficient K à cause de la température ambiante, raison pour laquelle la capacité thermique du réducteur résultera: $P_{T1} = 8 \times 0.85 = 6.8 \text{ kW}$

La vitesse en entrée étant égale à 1500 min⁻¹, le facteur $S = 1$

Puissance requise par l'application:

$$P = 4900 \times 1.9 / 9550 = 0.97 \text{ kW}$$

Puisque 6.8 kW > 0.97 kW aucun système de refroidissement auxiliaire du réducteur n'est nécessaire.

N.B. Important

Applications qui :

- demandent des durées de fonctionnement différentes de 10000 h,
- présentent des vitesses en entrée différentes de celles indiquées au catalogue
- sont caractérisées par des cycles de fonctionnement à charges et vitesses variables
- prévoient des charges axiales sur l'arbre en entrée/sortie du réducteur, doivent être examinées séparément, à l'aide de programmes de calcul dédiés, disponibles auprès du réseau de vente DANA.

6. EJEMPLO DE SELECCIÓN DEL REDUCTOR

Datos necesarios

Motor principal:
Eléctrico 1,5 kW a 1500 min⁻¹

Máquina accionada:
cinta transportadora con alimentación no uniforme
Servicio: continuo 10 horas diarias
Arranques por hora: 1
Par de funcionamiento objetivo: 4900 Nm
Par máximo de arranque: 9800 Nm
Velocidad de rotación: 1.85 min⁻¹
Vida mínima de la transmisión: 10000 h
Posición de funcionamiento: horizontal
Temperatura ambiente 30 °C
Ambiente de trabajo grande

Selección del reductor

Relación necesaria: 1500 / 1,85 = 810
Factor de aplicación K_A: 1.25
Par para seleccionar el reductor:

$$T_{2R} = 5000 \times K_A \times CS = 6125 \text{ Nm}$$

El reductor debe tener una $T_2 > T_{2R}$ par de referencia para seleccionar el reductor. Ir a la pág. 33 y en la columna T_N de la tabla seleccionar el valor mayor más cercano al resultado obtenido ($T_{2R}=6125$), es decir 6400 Nm; en el mismo renglón en la columna "Tipo" se encuentra el reductor idóneo para el 065; ir a la pág. 104 y en la tabla "Datos técnicos" seleccionar la relación "ieff" más cercana a $i=810$, que será $ieff=771.8$; en la columna de 1500 min⁻¹ para la relación seleccionada aparecerá un $T_2=7348$ Nm y el reductor tendrá una configuración "**EQ4065**".

Par máximo del reductor EQ4065 $T_{2max} = 10000 \text{ Nm} > 9500 \text{ Nm}$

Capacidad térmica del reductor EQ4065 $P_T = 8 \text{ kW}$.

Debido a la temperatura ambiente hay que aplicar el coeficiente K.

La capacidad térmica del reductor será:

$$P_{T1} = 8 \times 0.85 = 6.8 \text{ kW}$$

Como la velocidad de entrada es 1500 min⁻¹, hay que aplicar un factor S = 1

Potencia objetivo de la aplicación:

$$P = 4900 \times 1.9 / 9550 = 0.97 \text{ kW}$$

Como 6.8 kW > 0.97 kW no es necesario añadir sistema auxiliar de enfriamiento del reductor.

N.B. Importante

Las aplicaciones que:

- contemplan una duración mayor o menor que 10000 horas
- tienen velocidades de entrada diferentes de las que indica el catálogo
- se caracterizan porque los ciclos de trabajo tienen cargas y velocidades variables
- contemplan la presencia de cargas axiales en el eje de entrada o de salida del reductor se deben analizar por separado, por medio de programas de cálculo especiales que pueden solicitarse a la oficina comercial de DANA.

6. EXEMPLO DE SELEÇÃO DE REDUTOR

Dados para a seleção

Primeiro motor:
Elétrico 1,5 kW a 1500 min⁻¹

Máquina accionada:
fita transportadora não uniformemente alimentada
Serviço: contínuo de 10 horas por dia
Número de partidas por hora: 1
Torque de funcionamento requerido: 4900 Nm
Torque máximo na partida: 9800 Nm
Velocidade de rotação: 1.85 min⁻¹
Vida útil requerida para a transmissão: 10000 h
Posição de funcionamento: horizontal
Temperatura ambiente 30 °C
Ambiente de trabalho grande

Seleção do redutor

Relação requerida: 1500 / 1,85 = 810
Fator de aplicação K_A: 1.25
Torque para a seleção do redutor:

$$T_{2R} = 5000 \times K_A \times CS = 6125 \text{ Nm}$$

O redutor a ser selecionado deve ter um $T_2 > T_{2R}$ torque de referência para a seleção do redutor.

Portanto, ir à pág. 33 e, na tabela, selecionar na coluna T_N o valor imediatamente maior que o valor obtido ($T_{2R}=6125$), isto é, 6400 Nm; na mesma linha da coluna "Tipo" se lerá que o redutor idôneo terá um tamanho de 065; na pág. 104 correspondente, na tabela "Dados técnicos", selecionar a relação "ieff" mais próxima àquela solicitada de $i=810$, que será $ieff=771.8$, assim, ir à coluna equivalente a 1500 min⁻¹. Em correspondência à relação selecionada, será lido $T_2=7348$ Nm e, assim, o redutor terá uma configuração de "**EQ4065**".

O torque máximo do redutor EQ4065 $T_{2max} = 10000 \text{ Nm} > 9500 \text{ Nm}$

A capacidade térmica do redutor EQ4065 $P_T = 8 \text{ kW}$.

Em função da temperatura ambiente, é necessário considerar o coeficiente K, em função do qual a capacidade térmica do redutor tornase:

$$P_{T1} = 8 \times 0.85 = 6.8 \text{ kW}$$

Sendo a velocidade na entrada igual a 1500 min⁻¹, o fator S = 1

Potência requerida pela aplicação:

$$P = 4900 \times 1.9 / 9550 = 0.97 \text{ kW}$$

Sendo 6.8 kW > 0.97 kW não é necessário nenhum sistema de arrefecimento auxiliar para o redutor.

OBS. Importante

Aplicações que:

- requeiram valores de duração diferentes das 10000 horas
- apresentem velocidades na entrada diferentes daquelas indicadas no catálogo
- são caracterizadas por ciclos de trabalho com cargas e velocidades variáveis
- prevêem a presença de cargas axiais no eixo de entrada/saída do redutor devem ser analisadas especificamente com o auxílio de programas de cálculo dedicado, disponíveis na organização de vendas da DANA.

Tutti i rapporti evidenziati (es. 10.50) hanno dimensioni particolari della coppia conica in certe versioni; vedere tavole dimensionali.

All ratios grey highlighted (ex. 10.50) have specific dimensions of the bevel gear set in some versions; see dimensional tables.

Alle mit (es. 10.50) gekennzeichneten Übersetzungen haben in bestimmten Versionen besondere Dimensionen des Kegelradtriebs. Siehe auch Dimensionstabellen.

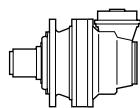

Les rapports repérés par (es. 10.50) ont des dimensions de couple conique particulières. Voir les tableaux dimensionnels.

Todas las relaciones indicadas con (es. 10.50) tienen dimensiones particulares del par cónico según las versiones; ver las tablas de dimensión.

As relações marcadas com (es. 10.50) têm dimensões particulares da engrenagem cônica em certas versões; vide tabelas dimensionais.

Tutti i rapporti evidenziati (es. 10.50) hanno dimensioni particolari della coppia conica in certe versioni; vedere tavole dimensionali.

All ratios grey highlighted (ex. 10.50) have specific dimensions of the bevel gear set in some versions; see dimensional tables.

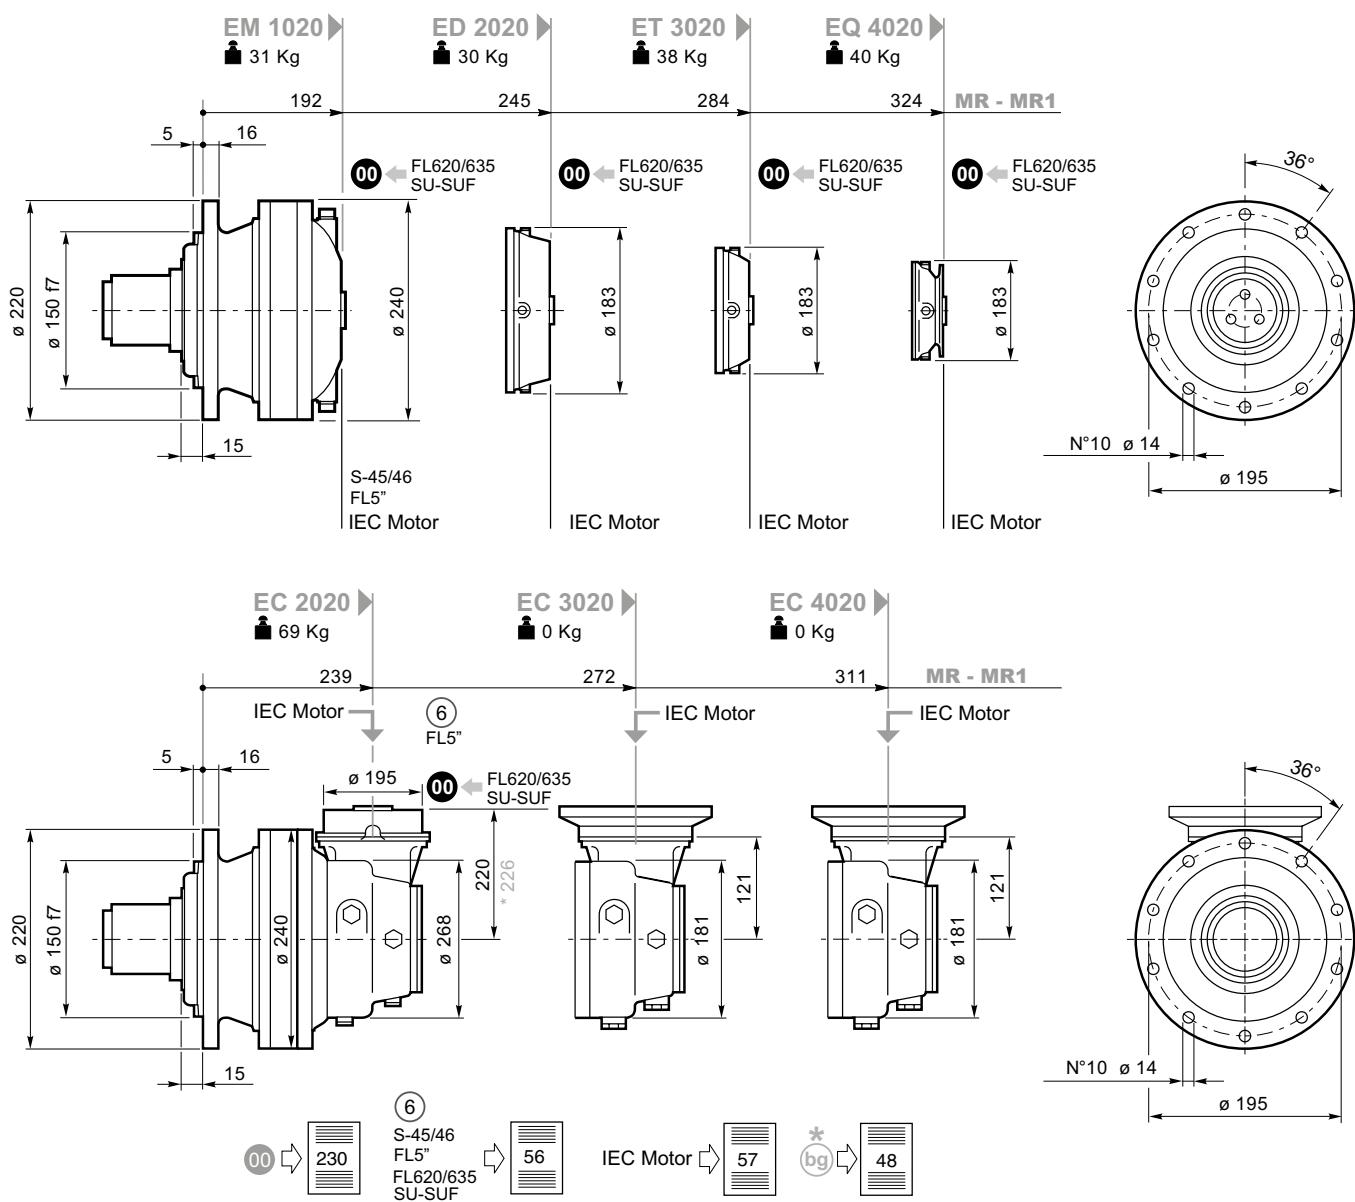

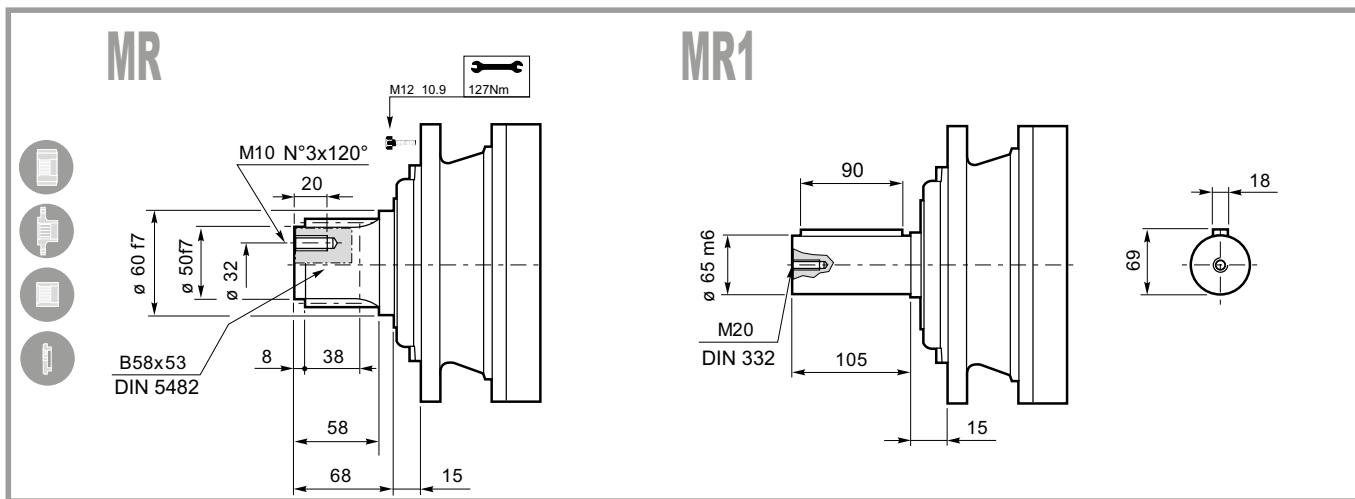

Alle mit (es. 10.50) gekennzeichneten Übersetzungen haben in bestimmten Versionen besondere Dimensionen des Kegelradtriebs. Siehe auch Dimensionstabellen.

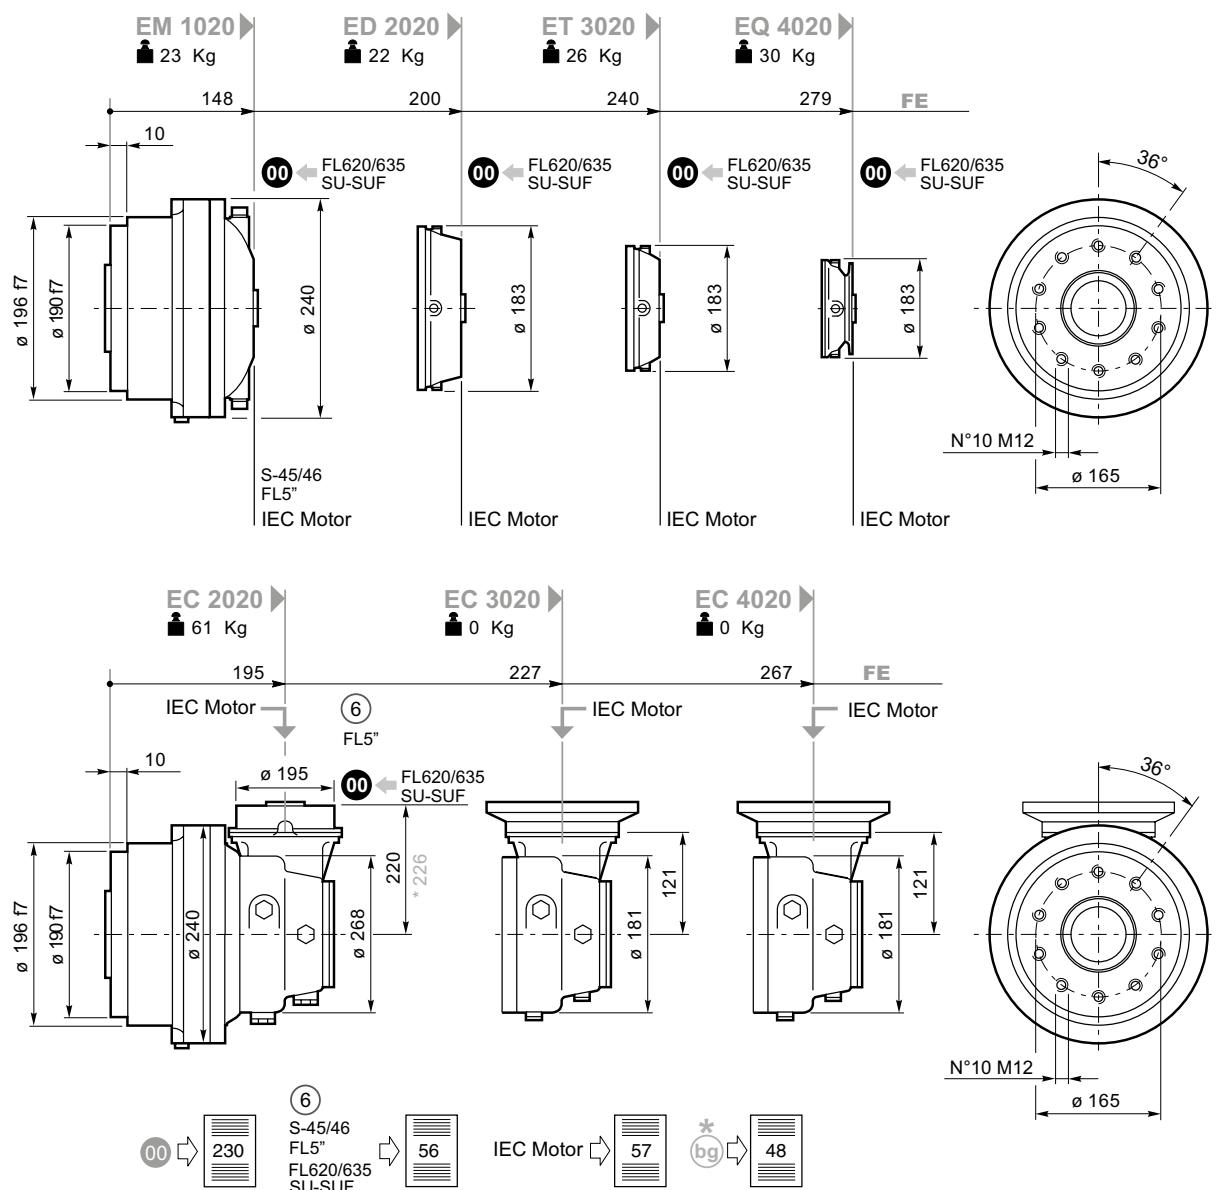

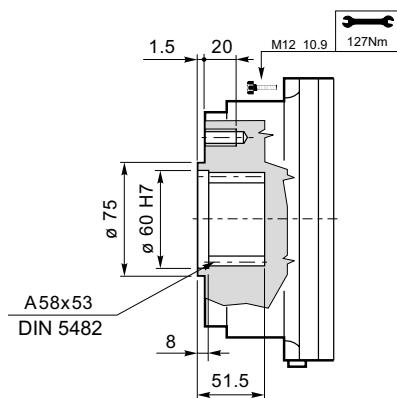

Les rapports repérés par (es. 10.50) ont des dimensions de couple conique particulières. Voir les tableaux dimensionnels.

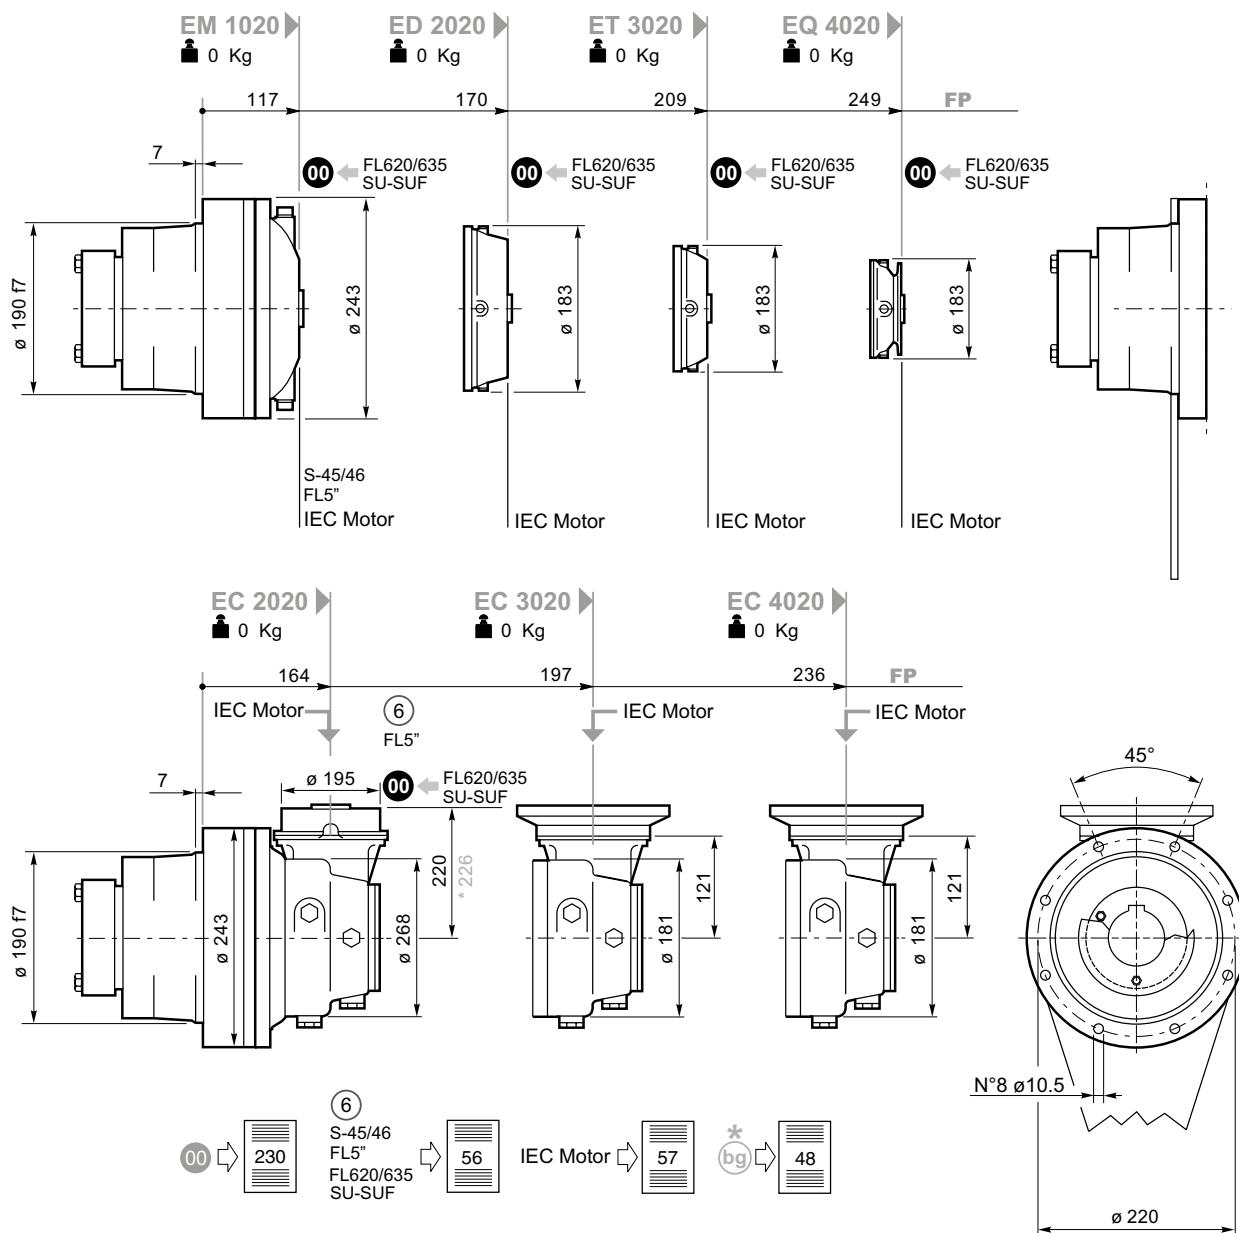

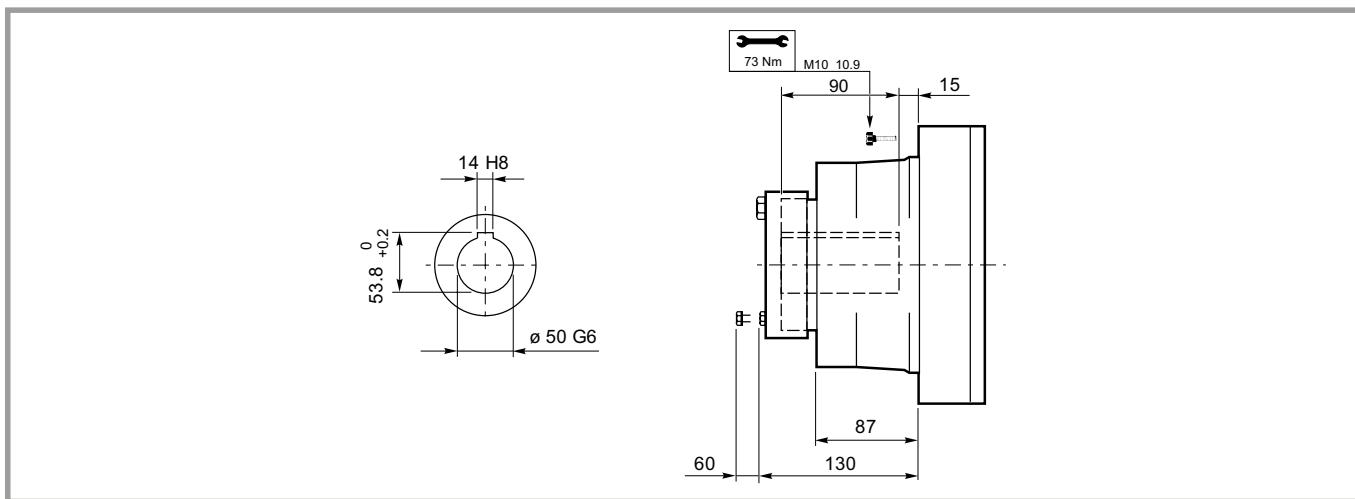

Todas las relaciones indicadas con (es. 10.50) tienen dimensiones particulares del par cónico según las versiones; ver las tablas de dimensión.

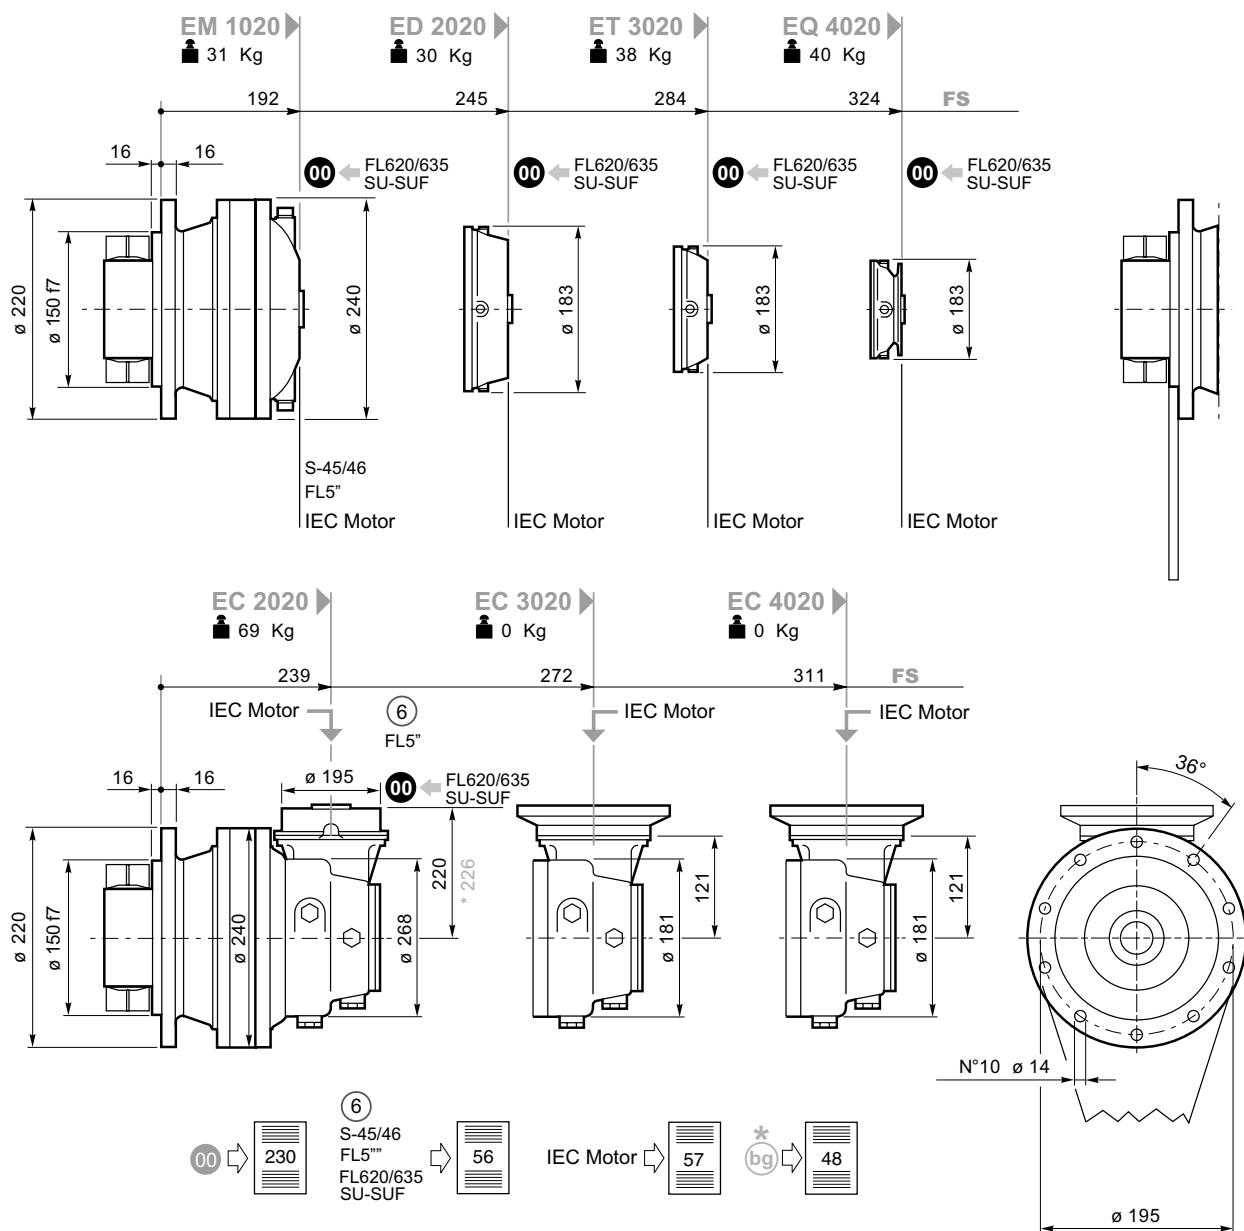

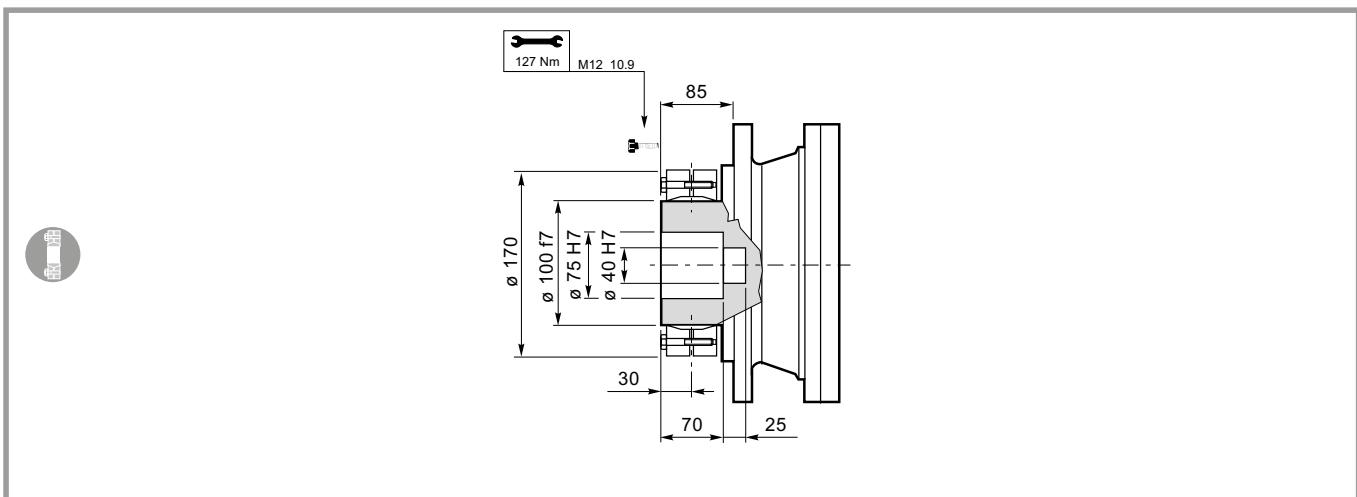

As relações marcadas com (es. 10.50) têm dimensões particulares da engrenagem cônica em certas versões; vide tabelas dimensionais.

S45CR1-S46C1**SU2****(6) 48.82**

Per le configurazioni in entrata: S46C1, 48.82 (CC40 - CC41), FL5" è disponibile a richiesta il dispositivo antiritorno; per ulteriori informazioni e dati tecnici consultare il referente DANA di zona.

Anti-run back device is available for following input settings: S46C1, 48.82 (CC40 - CC41), FL5"; for further information and technical data please consult the DANA area contact person.

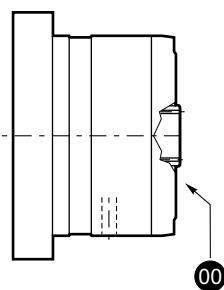

Für die Antriebskonfigurationen: S46C1, 48.82 (CC40 - CC41), FL5" ist auf Anfrage eine Rücklaufsperrre verfügbar. Weitere Informationen und die Technischen Daten Sich an die DANA Kontaktperson der zone zu wenden.

Pour les configurations d'entrée : S46C1, 48.82 (CC40 - CC41), FL5" le dispositif antidévireur est disponible sur demande ; pour toute information supplémentaire ou toutes données techniques, consulter la personne de référence de la zone DANA.

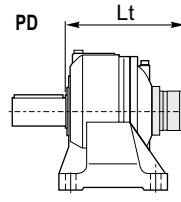

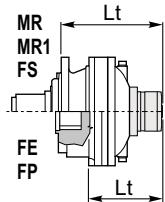

Para las configuraciones en entrada: S46C1, 48.82 (CC40 - CC41), FL5" , se encuentra disponible a pedido, el dispositivo antirretrocesos; para ulteriores informaciones y datos técnicos, consulte a la persona de contacto del área de DANA.

Para as configurações na entrada: S46C1, 48.82 (CC40 - CC41), FL5" está disponível, a pedido, o dispositivo contra-recuos; para mais informações e dados técnicos, consulte seu contato local da DANA.

Tutti i rapporti evidenziati (es. 10.50) hanno dimensioni particolari della coppia conica in certe versioni; vedere tavole dimensionali.

All ratios grey highlighted (ex. 10.50) have specific dimensions of the bevel gear set in some versions; see dimensional tables.

Alle mit (es. 10.50) gekennzeichneten Übersetzungen haben in bestimmten Versionen besondere Dimensionen des Kegelradtriebs. Siehe auch Dimensionstabellen.

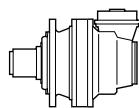

Les rapports repérés par (es. 10.50) ont des dimensions de couple conique particulières. Voir les tableaux dimensionnels.

Todas las relaciones indicadas con (es. 10.50) tienen dimensiones particulares del par cónico según las versiones; ver las tablas de dimensión.

As relações marcadas com (es. 10.50) têm dimensões particulares da engrenagem cônica em certas versões; vide tabelas dimensionais.

Tutti i rapporti evidenziati (es. 10.50) hanno dimensioni particolari della coppia conica in certe versioni; vedere tavole dimensionali.

All ratios grey highlighted (ex. 10.50) have specific dimensions of the bevel gear set in some versions; see dimensional tables.

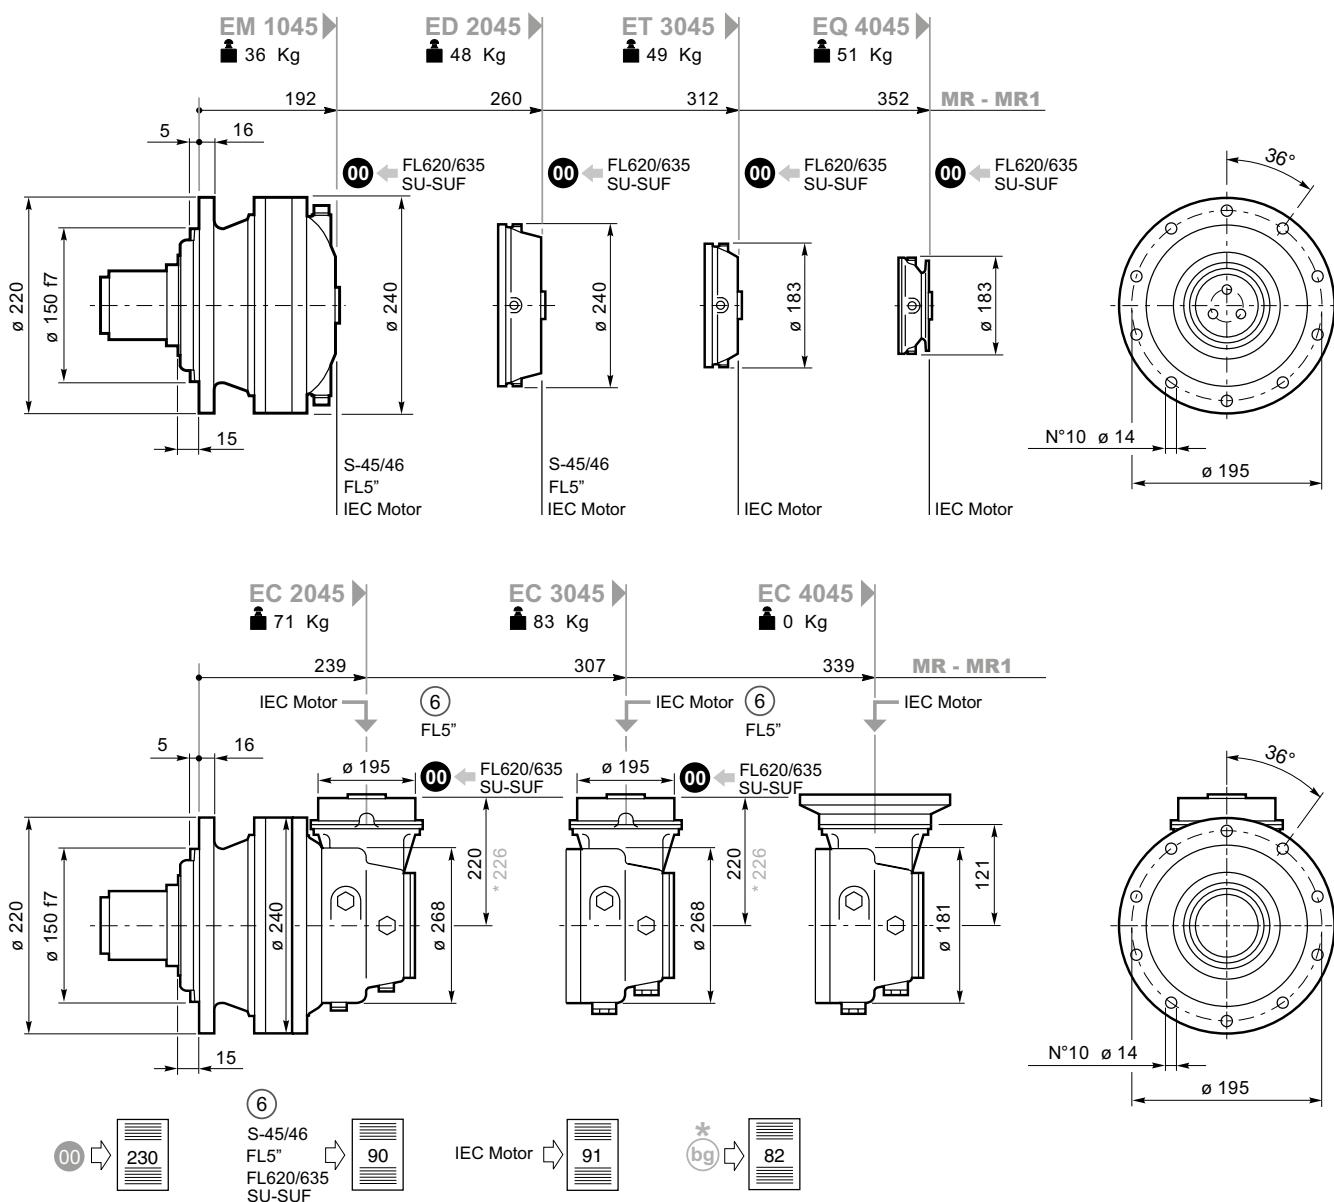

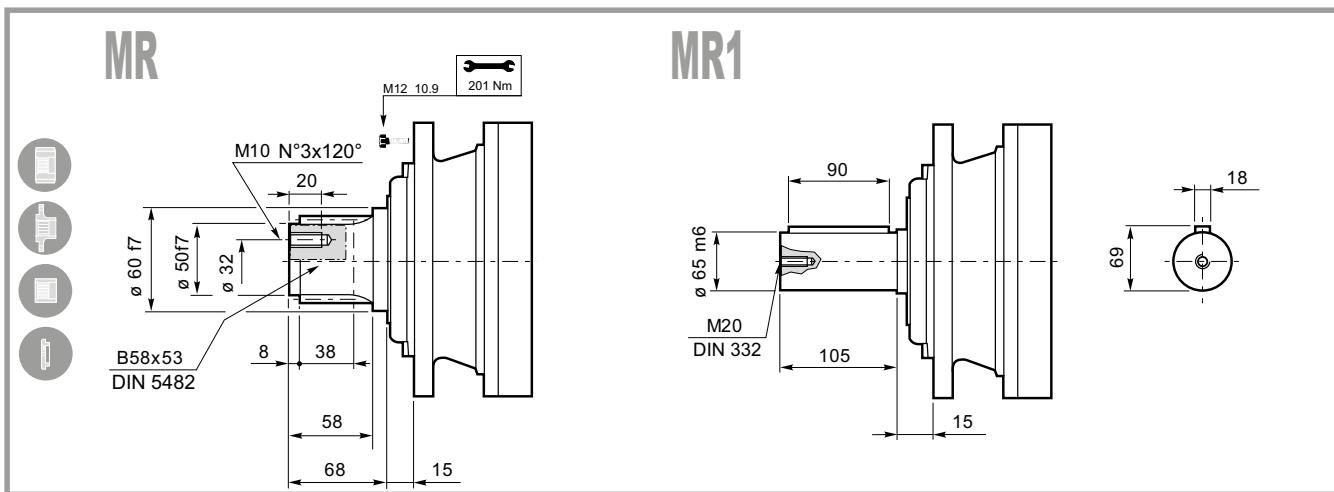

Alle mit (es. 10.50) gekennzeichneten Übersetzungen haben in bestimmten Versionen besondere Dimensionen des Kegelradtriebs. Siehe auch Dimensionstabellen.

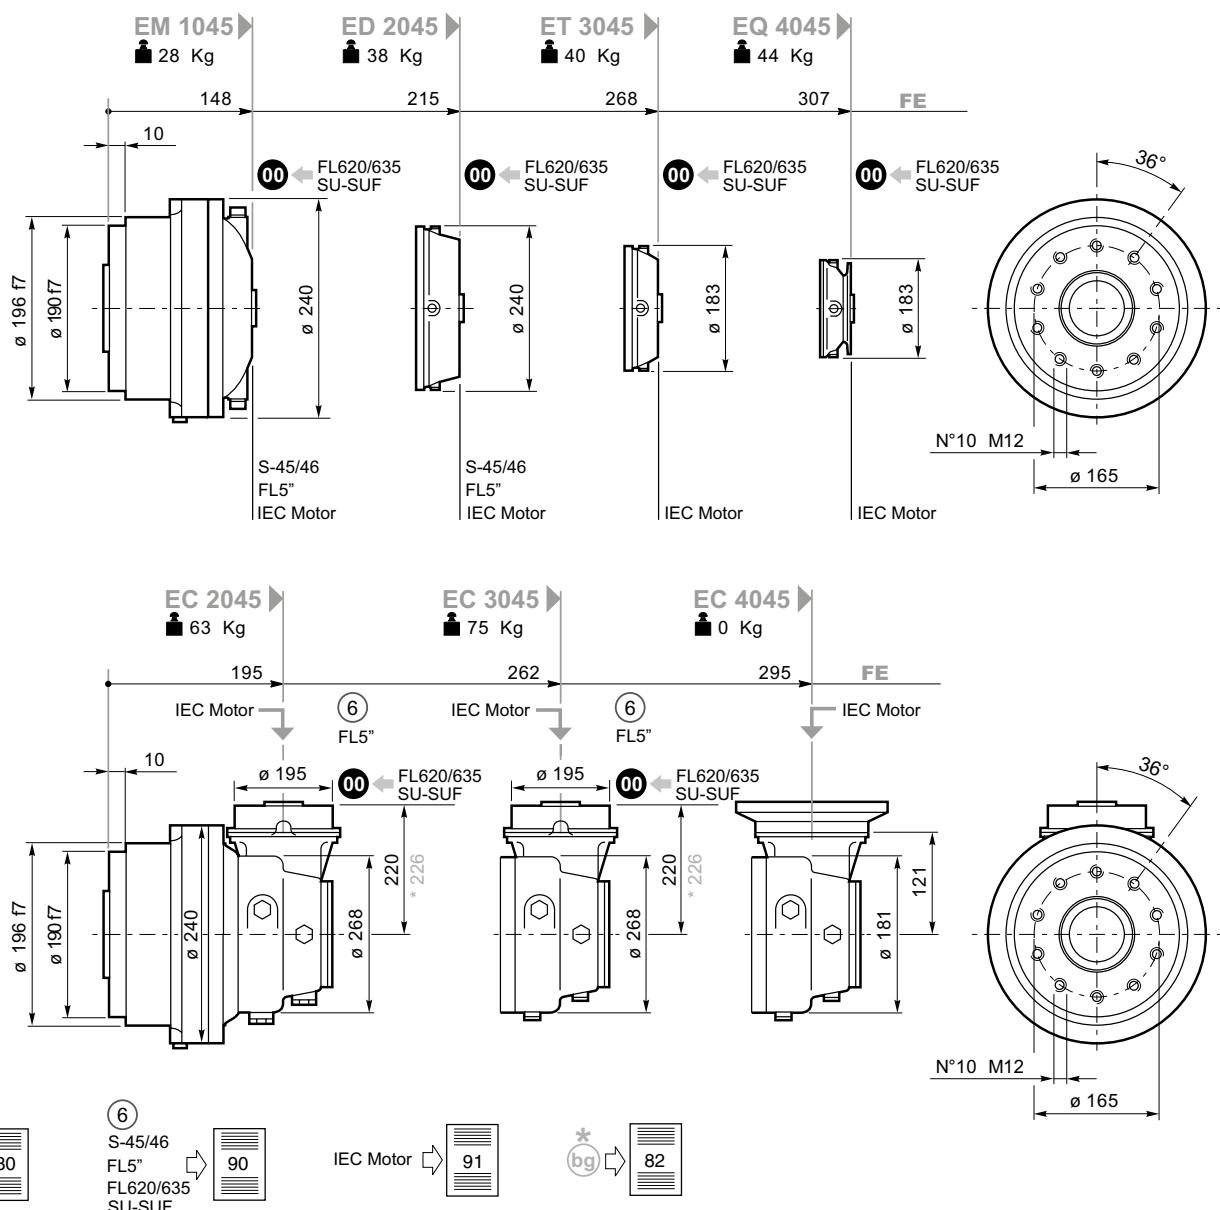

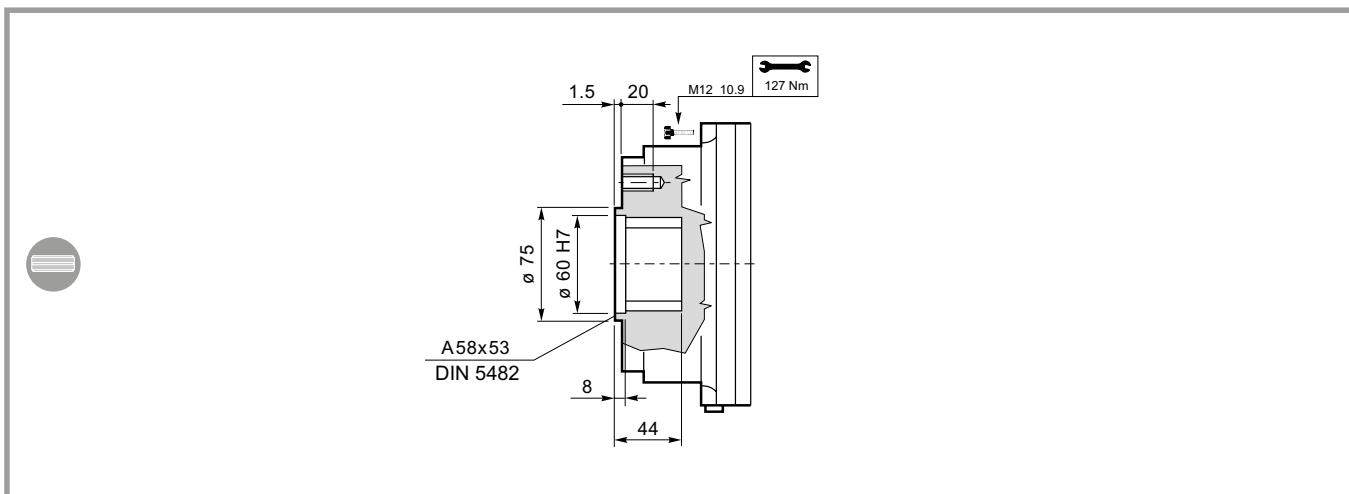

Les rapports repérés par (es. 10.50) ont des dimensions de couple conique particulières. Voir les tableaux dimensionnels.

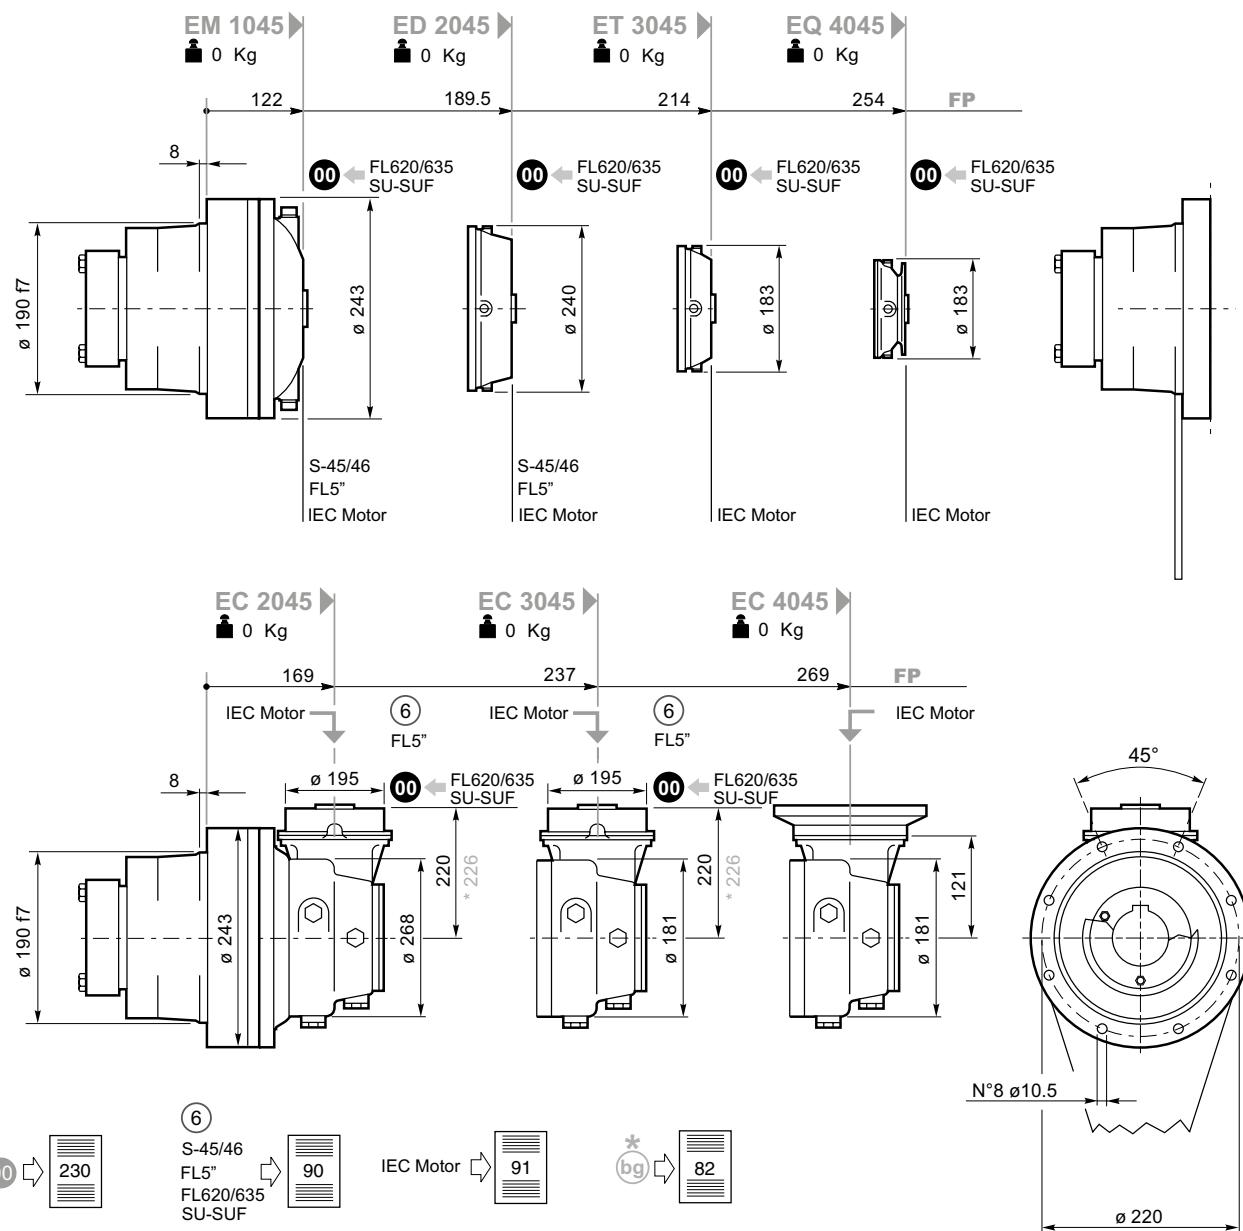

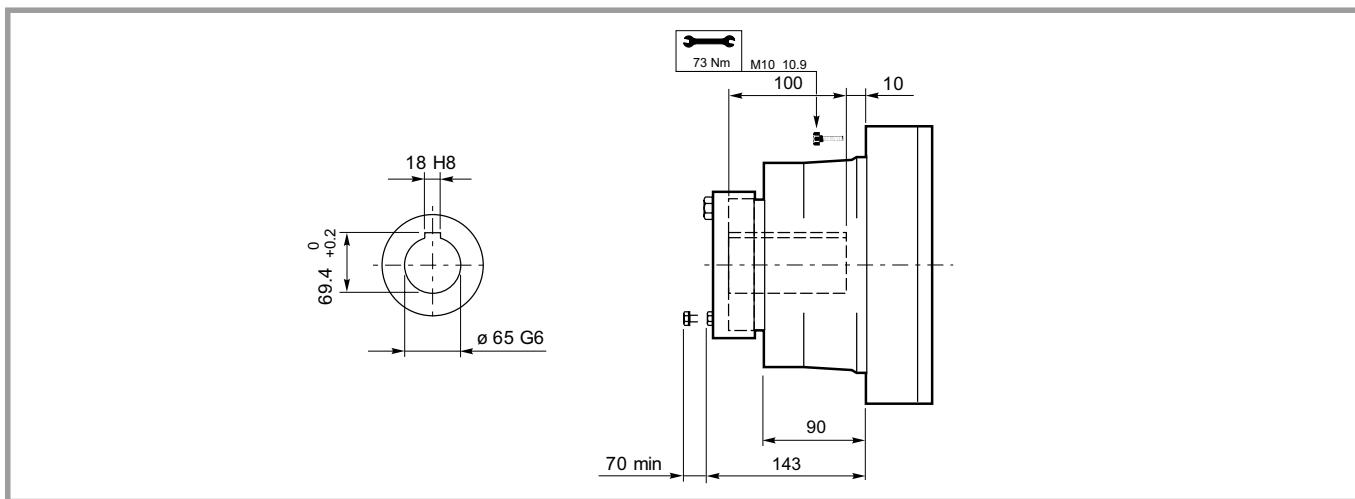

Todas las relaciones indicadas con (es. 10.50) tienen dimensiones particulares del par cónico según las versiones; ver las tablas de dimensión.

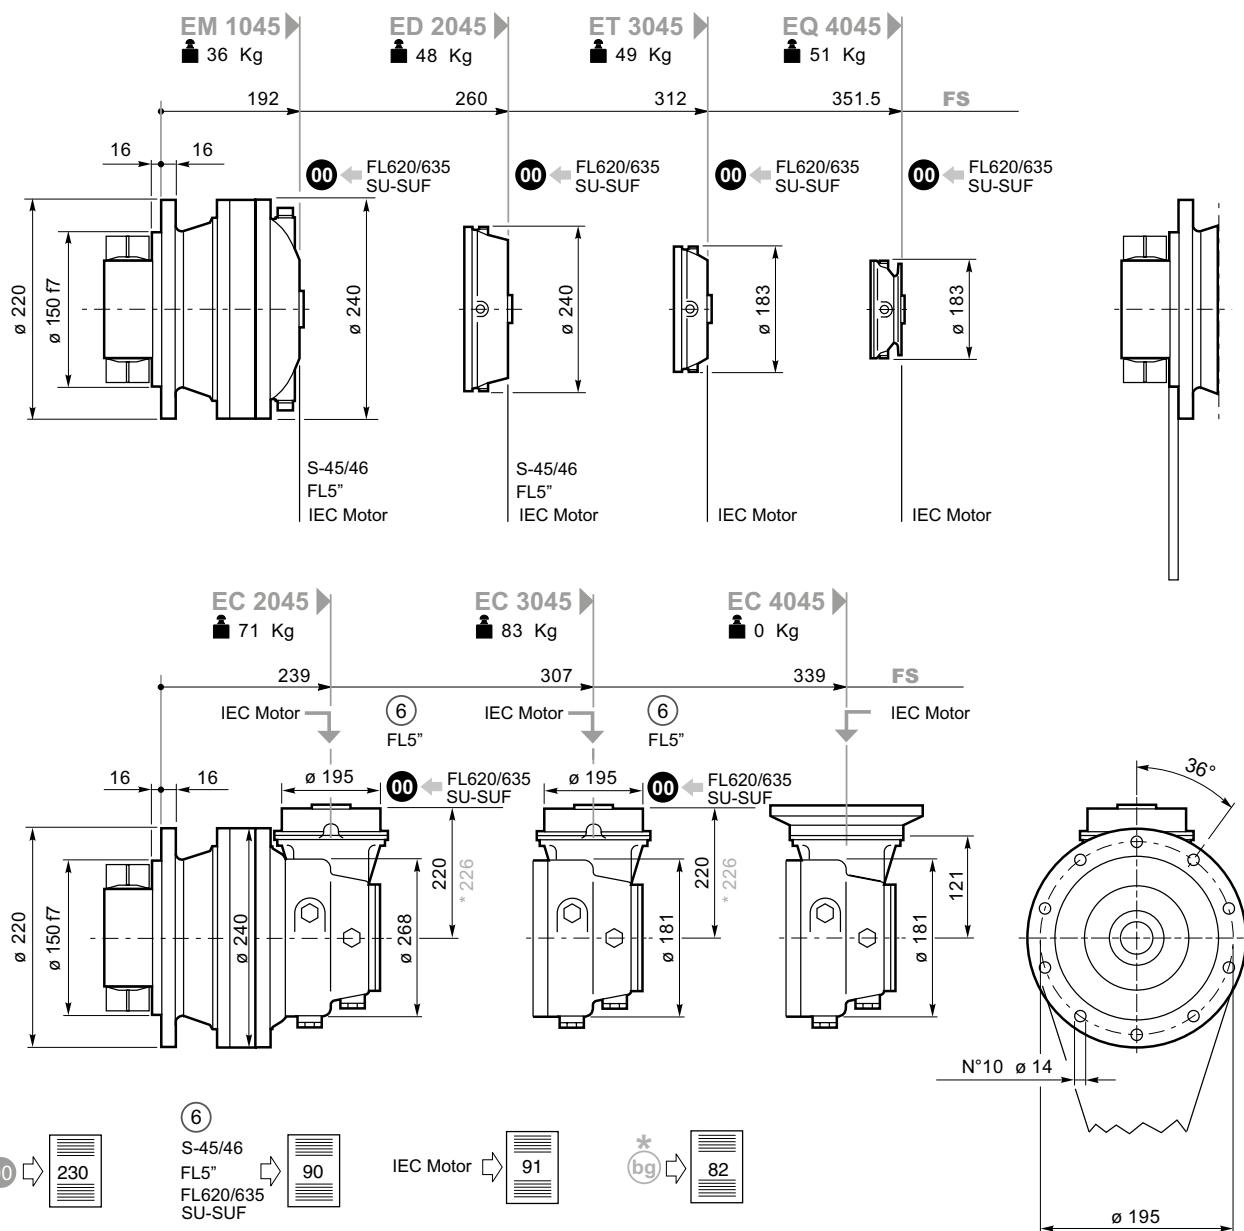

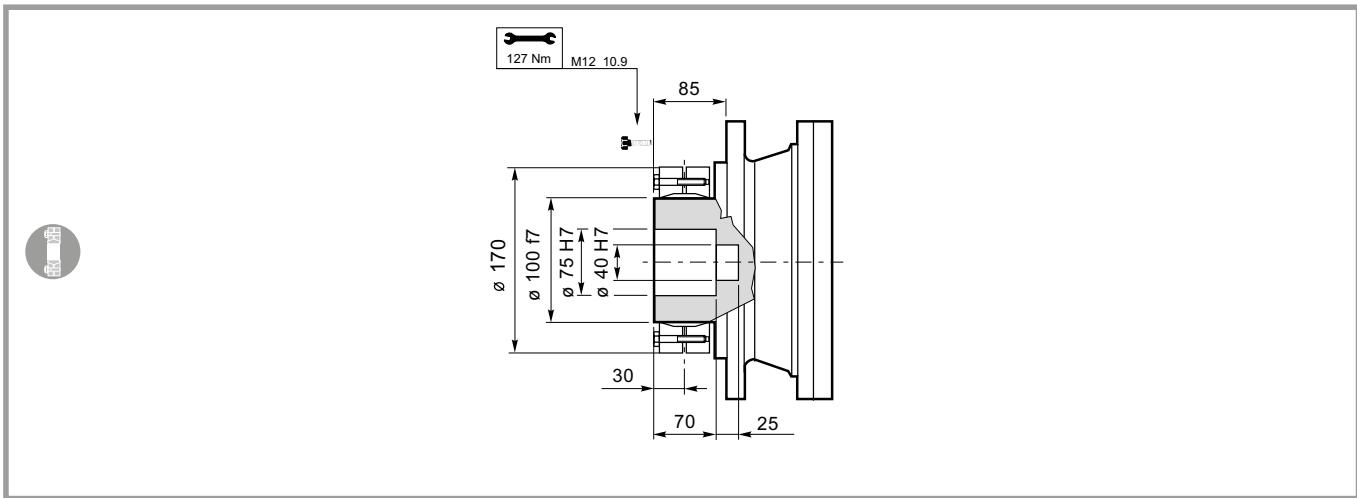

As relações marcadas com (es. 10.50) têm dimensões particulares da engrenagem cônica em certas versões; vide tabelas dimensionais.

Per le configurazioni in entrata: S46C1, 48.82 (CC40 - CC41), FL5" è disponibile a richiesta il dispositivo antiritorno; per ulteriori informazioni e dati tecnici consultare il referente DANA di zona.

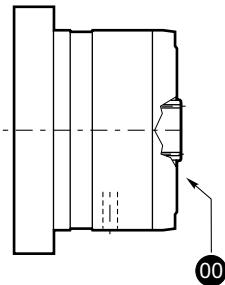

Anti-run back device is available for following input settings: S46C1, 48.82 (CC40 - CC41), FL5"; for further information and technical data please consult the DANA area contact person.

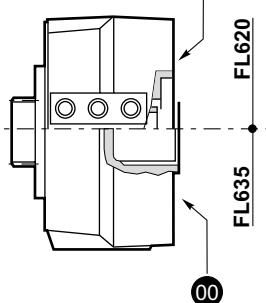

Für die Antriebskonfigurationen: S46C1, 48.82 (CC40 - CC41), FL5" ist auf Anfrage eine Rücklaufsperrre verfügbar. Weitere Informationen und die Technischen Daten Sich an die DANA Kontaktperson der zone zu wenden.

! Pour les configurations d'entrée : S46C1, 48.82 (CC40 - CC41), FL5" le dispositif antidévireur est disponible sur demande ; pour toute information supplémentaire ou toutes données techniques, consulter la personne de référence de la zone DANA.

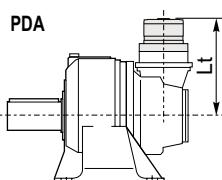

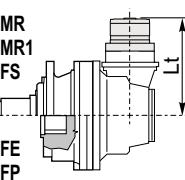

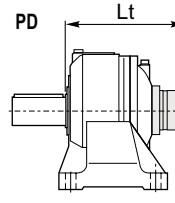

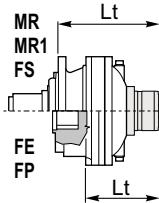

Para las configuraciones en entrada: S46C1, 48.82 (CC40 - CC41), FL5", se encuentra disponible a pedido, el dispositivo antirretrocesos; para ulteriores informaciones y datos técnicos, consulte a la persona de contacto del área de DANA.

Para as configurações na entrada: S46C1, 48.82 (CC40 - CC41), FL5" está disponível, a pedido, o dispositivo contra-recuos; para mais informações e dados técnicos, consulte seu contato local da DANA.

Per le configurazioni in entrata: S46C1, S65CR1, 48.82 (CC40 - CC41), FL5" è disponibile a richiesta il dispositivo antiritorno; per ulteriori informazioni e dati tecnici consultare il referente DANA di zona.

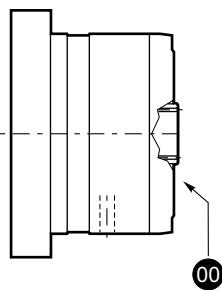

Anti-run back device is available for following input settings: S46C1, S65CR1, 48.82 (CC40 - CC41), FL5"; for further information and technical data please consult the DANA area contact person.

Für die Antriebskonfigurationen: S46C1, S65CR1, 48.82 (CC40 - CC41), FL5" ist auf Anfrage eine Rücklaufsperre verfügbar. Weitere Informationen und die Technischen Daten Sich an die DANA Kontaktperson der zone zu wenden.

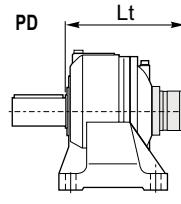

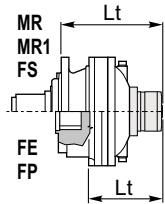

Pour les configurations d'entrée : S46C1, S65CR1, 48.82 (CC40 - CC41), FL5" le dispositif antidévireur est disponible sur demande ; pour toute information supplémentaire ou toutes données techniques, consulter la personne de référence de la zone DANA.

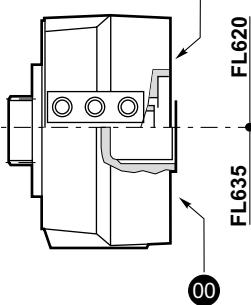

Para las configuraciones en entrada: S46C1, S65CR1, 48.82 (CC40 - CC41), FL5" , se encuentra disponible a pedido, el dispositivo antirretrocesos; para ulteriores informaciones y datos técnicos, consulte a la persona de contacto del área de DANA.

Para as configurações na entrada: S46C1, S65CR1, 48.82 (CC40 - CC41), FL5" está disponível, a pedido, o dispositivo contra-recuos; para mais informações e dados técnicos, consulte seu contato local da DANA.

IEC Motor  153

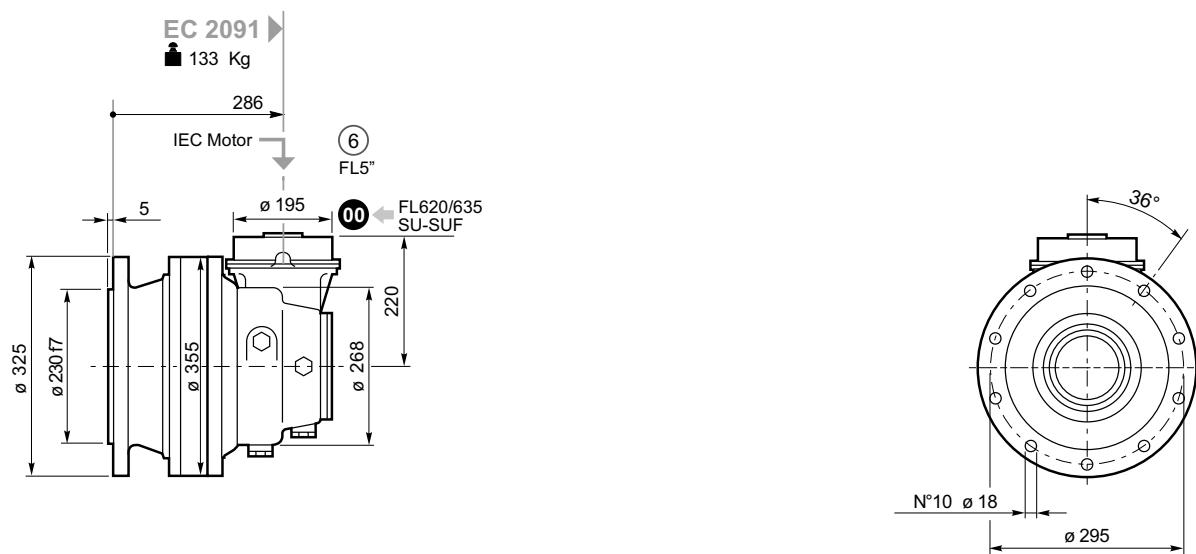

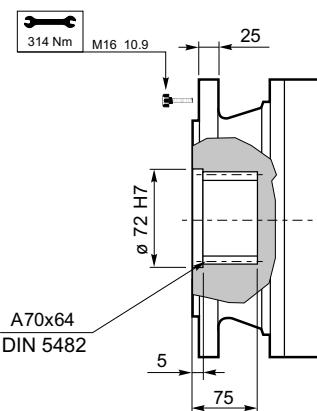

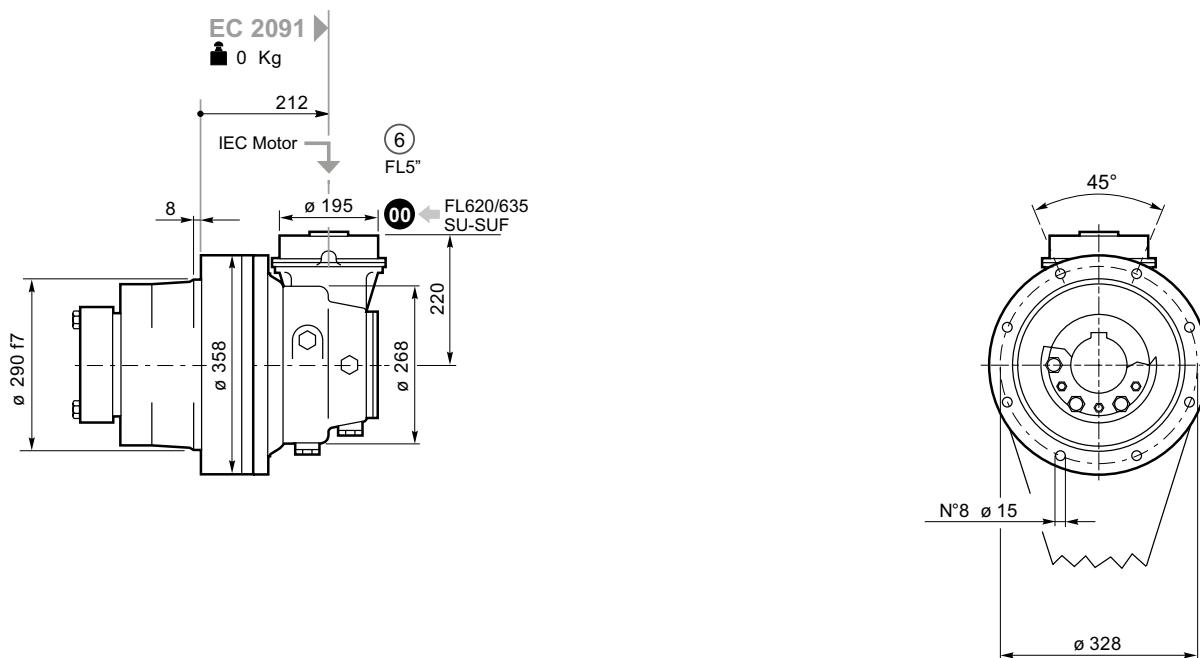

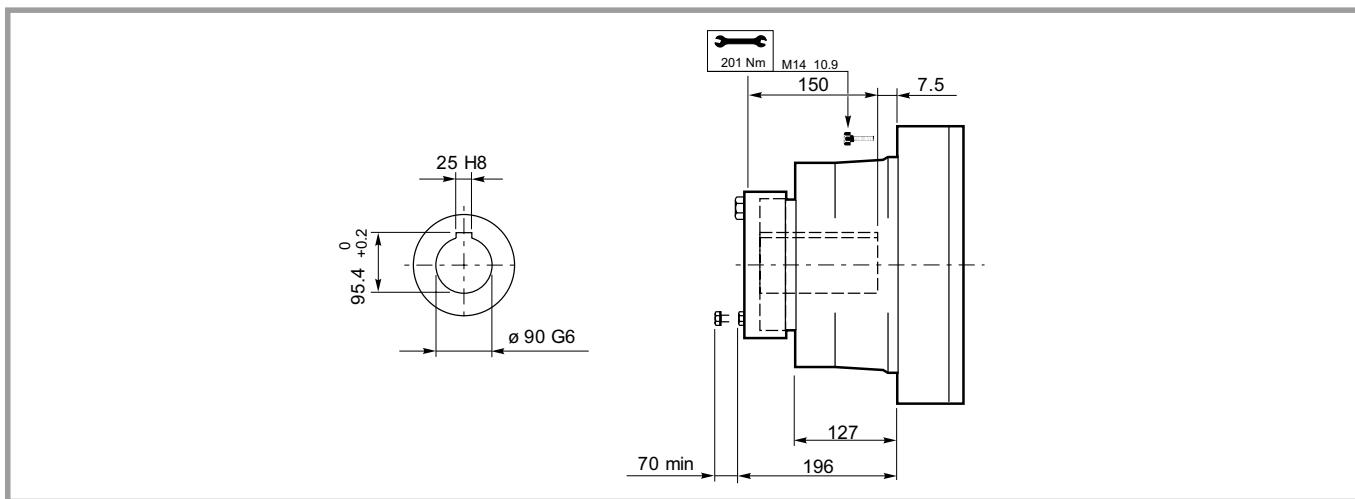

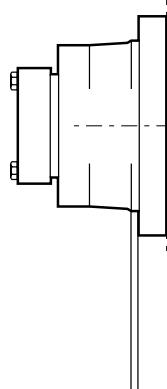

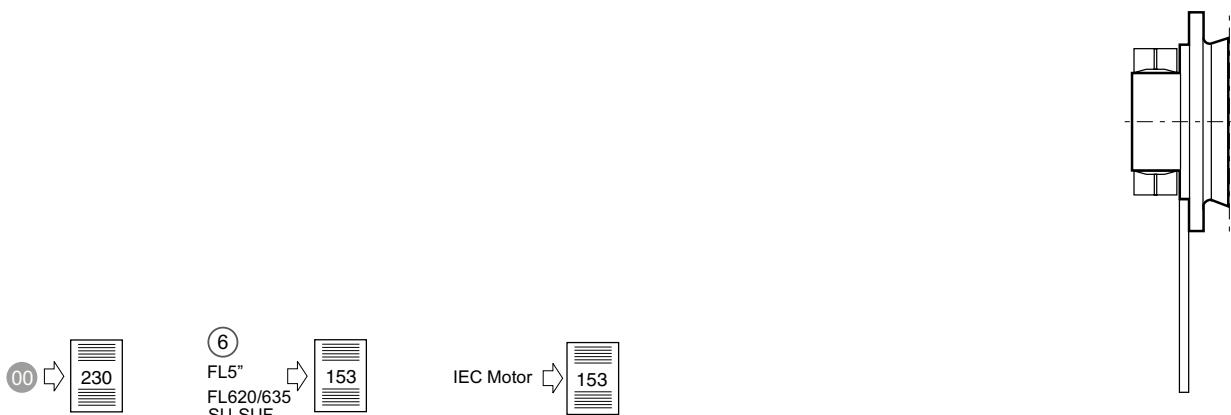

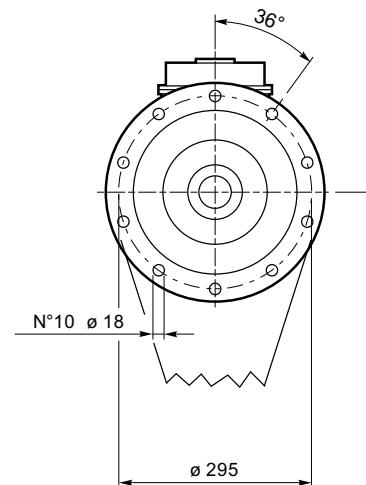

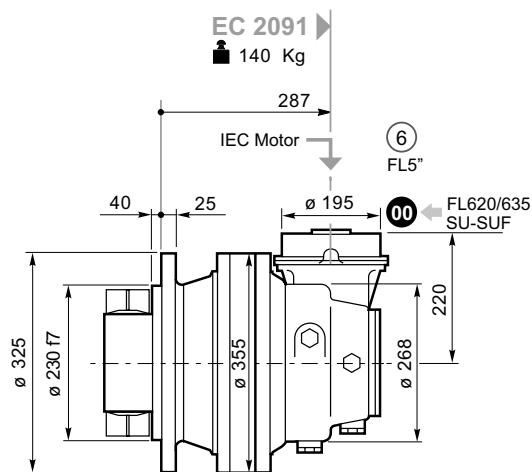

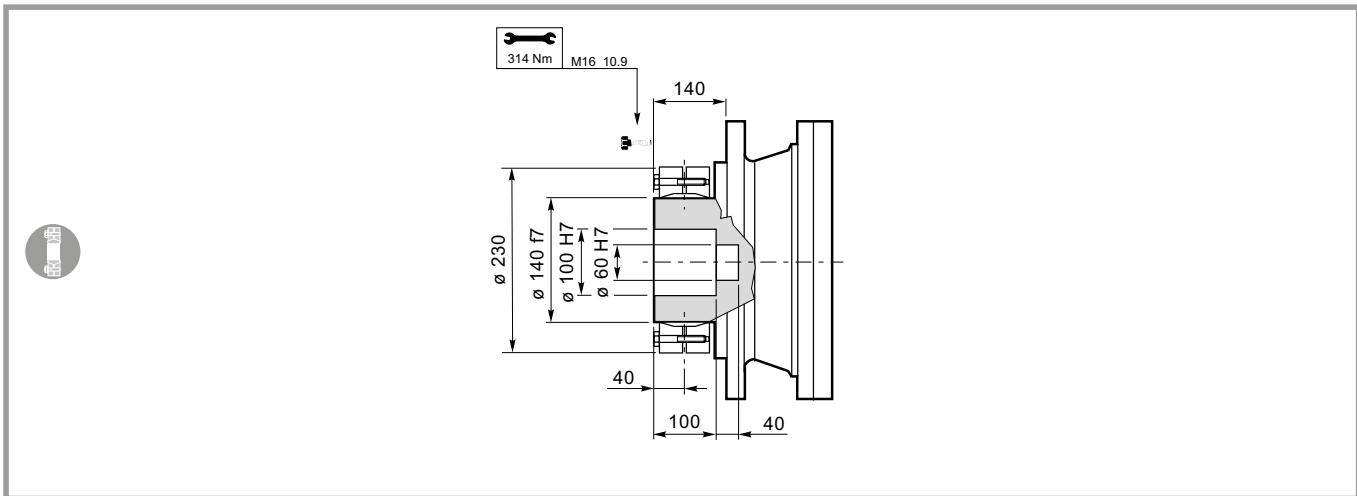

Diagram illustrating the connection between a drive and a motor:

- The drive is labeled **230**.
- A circled **6** is positioned above the drive.
- The drive is connected to a motor labeled **153**.
- The motor is also connected to an **IEC Motor**.

9. SUPPORTI MASCHIO IN ENTRATA

Gli alberi di entrata descritti di seguito sono utilizzati quando il motore di azionamento, generalmente elettrico, è collegato all'albero di entrata mediante giunto elastico, o puleggia e cinghie.

La normale posizione di montaggio è con l'asse orizzontale; per altre posizioni di montaggio, occorre regolare la lubrificazione. Si prega di consultare il referente DANA di zona per maggiori dettagli. La velocità massima di lavoro è generalmente 1800 min⁻¹.

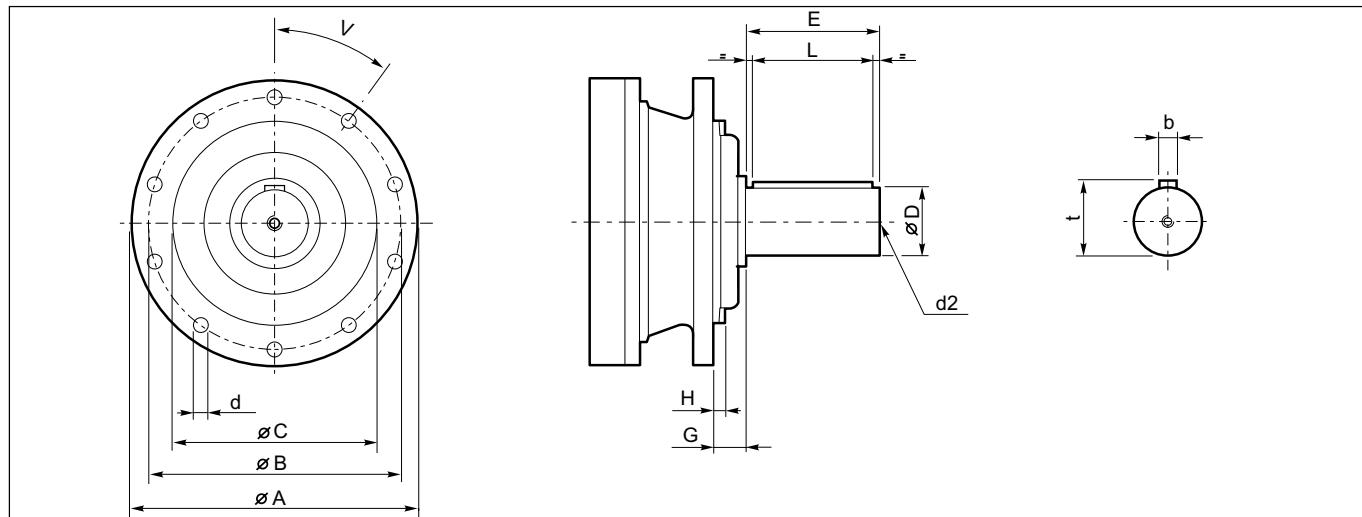

9. INPUT MALE SHAFTS

Input shafts described below are used when the driving motor, which is usually electric, is connected to the input shaft by flexible coupling or belts and pulleys. Normal mounting position is with horizontal axis; for different positions the lubrication solution must be adjusted: please to consult the DANA area contact person. Max working speed is generally 1800 min⁻¹.

9. ANTRIEBSWELLEN-STÜMPFE

Die im Folgenden beschriebenen Antriebswellen werden eingesetzt, wenn der normalerweise elektrische Antriebsmotor mittels einer elastischen Kupplung oder mithilfe von Riemenscheiben und Riemen angeschlossen wird.

Die normale Einbaulage ist horizontal; für andere Einbaupositionen muss die Schmierung eingestellt werden. für mehr Details, Wir empfehlen Ihnen, Sich an die DANA Kontaktperson der zone zu wenden. Die maximale Betriebsdrehzahl beträgt meist 1800 min⁻¹.

9. PALIER MALES EN ENTREE

Les arbres d'entrée décrits ci-après sont utilisés lorsque le moteur d'entraînement, généralement électrique, est relié à l'arbre d'entrée par un accouplement élastique ou poulie et courroie.

La position normale de montage est avec l'axe horizontal; pour les autres positions de montage, il faut régler la lubrification. Pour plus de détails, nous vous recommandons de consulter la personne de référence de la zone DANA.

La vitesse maximale de fonctionnement est généralement de 1800 min⁻¹.

9. SOPORTES MACHO EN LA ENTRADA

Los ejes de entrada que se describen a continuación se utilizan cuando el motor de accionamiento (generalmente eléctrico) está conectado el eje de entrada por medio de un acoplamiento elástico o de una polea y correas.

En la posición de montaje normal el eje es horizontal; en las demás posiciones es preciso ajustar la lubricación. Para mas detalles, le recomendamos que consulte a la persona de contacto del área de DANA.

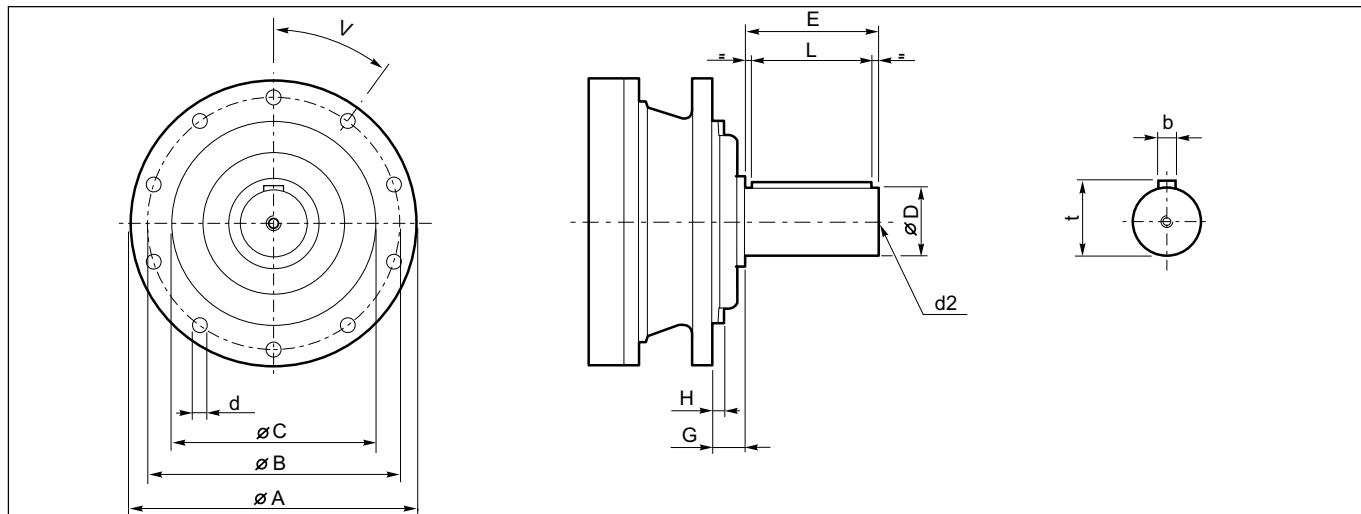

La velocidad máxima de trabajo suele cercarse a 1800 min⁻¹.

9. SUPORTES MACHO NA ENTRADA

Os eixos de entrada descritos a seguir são utilizados quando o motor de acionamento, geralmente elétrico, é conectado ao eixo de entrada através de uma junta elástica ou polia e correia.

A posição de montagem normal é com o eixo horizontal; para mais detalhes, recomendamos que você consulte seu contato local da DANA.

A velocidade máxima de serviço é geralmente de 1800 min⁻¹.

Supporti maschio per entrata universale

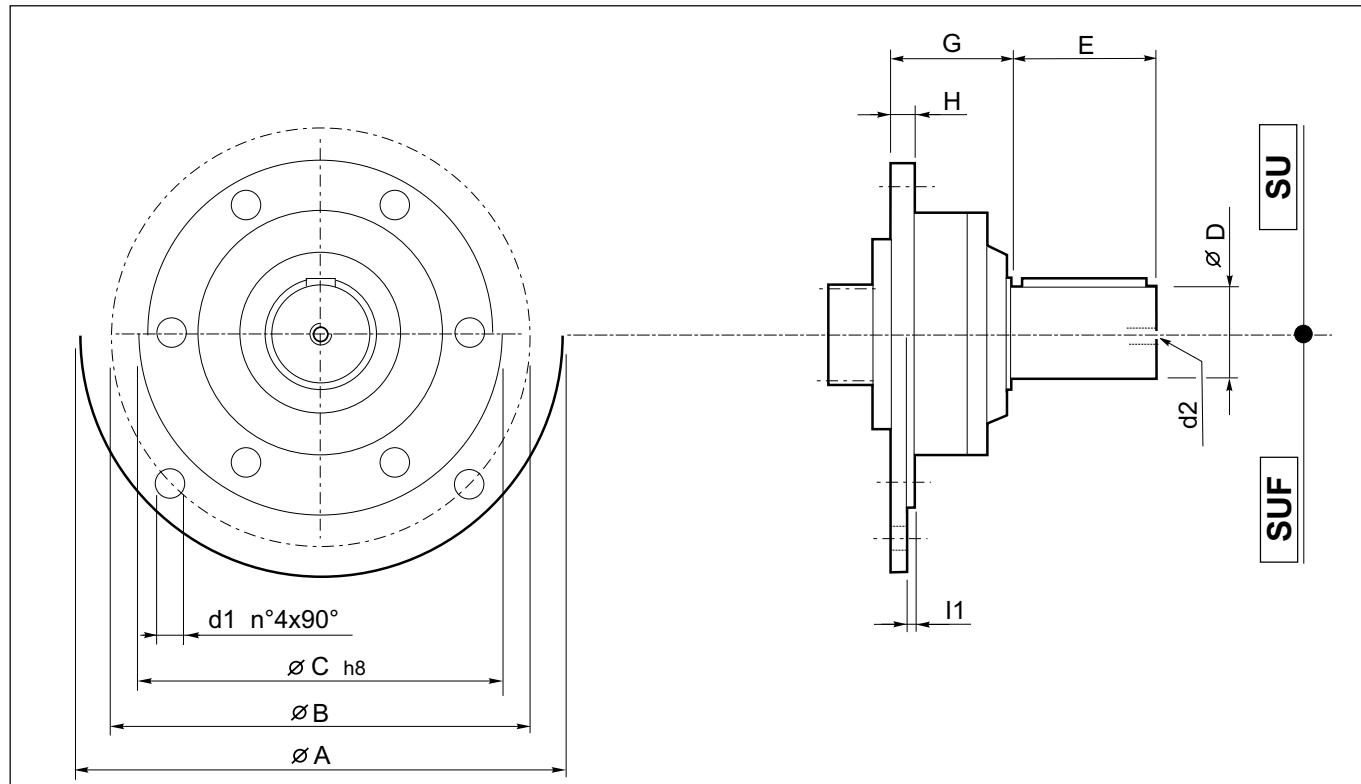

I tipi SU sono generalmente utilizzati con un giunto elastico, possono essere montati direttamente su qualsiasi tipo di riduttore con entrata universale 00 e possono essere forniti separatamente. Vedere la sezione relativa ai riduttori per dimensioni e carichi radiali.

Male shafts for universal input

These types generally used in combination with a flexible coupling. They fit directly onto any type of gear unit with universal input type 00 and can be supplied separately. See gearbox sections for dimensions and radial loads.

Wellenstümpfe für Universalantriebe

Die Typen der Baureihe SU werden gewöhnlich mit einer elastischen Kupplung verwendet, können direkt auf jede Getriebeart mit Universalantrieb 00 montiert werden und sind separat lieferbar. Für Abmessungen und Radiallasten siehe Abschnitt Getriebe.

Palier mâle pour prédisposition d'entrée universelle

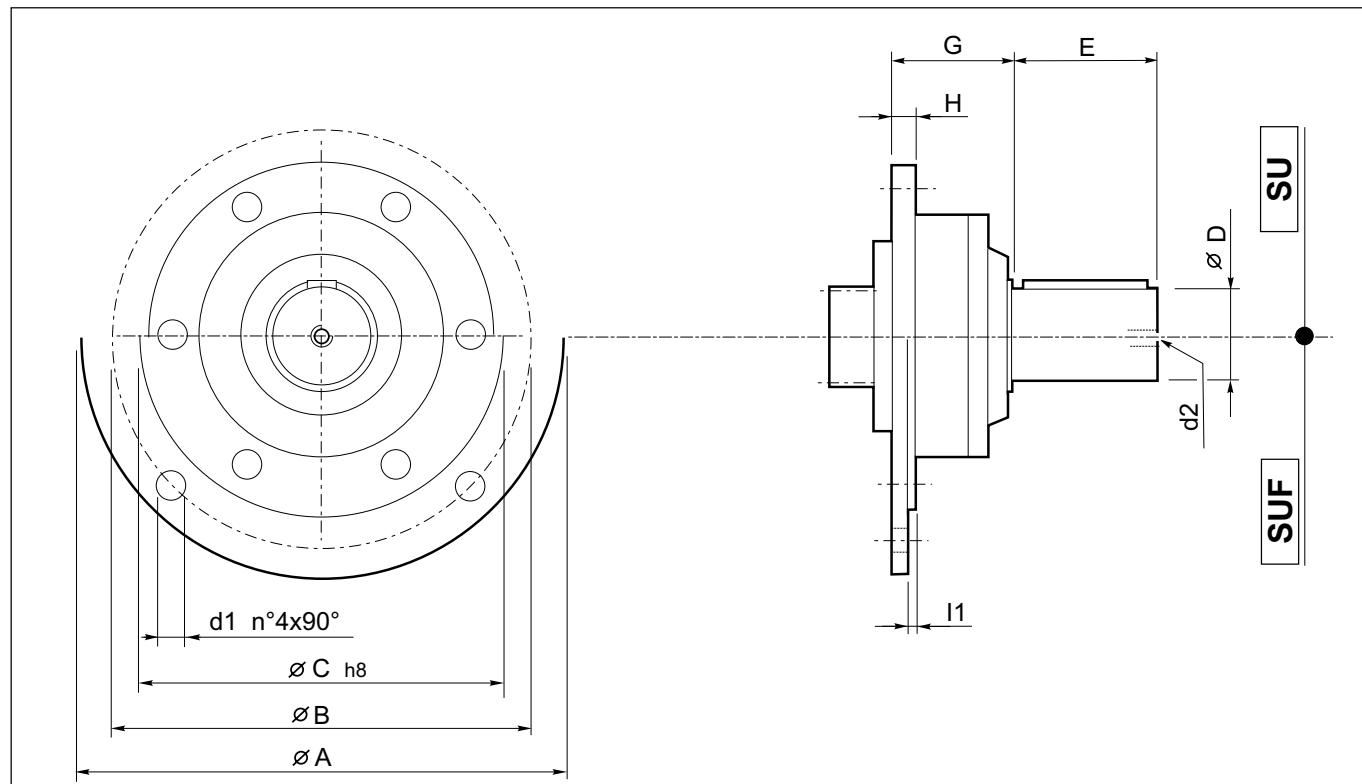

Les types SU sont généralement utilisés avec un accouplement élastique, peuvent être directement monté sur n'importe quel type de réducteur avec arbre d'entrée universel 00 et peuvent être livrés séparément. Voir section relative aux réducteurs pour les dimensions et les charges radiales.

Soportes macho para entrada universal

Los del tipo SU se utilizan generalmente con un empalme elástico y se montan en cualquier reduktor con entrada universal 00. Pueden solicitarse por separado. Las dimensiones y las cargas radiales pueden verse en la sección dedicada a los reductores.

Suportes macho para entrada universal

Os tipos SU são geralmente utilizados com uma junta elástica, podem ser montados diretamente em qualquer tipo de redutor com entrada universal 00 e podem ser fornecidos separadamente. Consulte a seção relativa aos redutores para obter as dimensões e as cargas radiais.

10. FRENI LAMELLARI A BAGNO D'OLIO

I riduttori di questo catalogo possono essere dotati in entrata di freno a dischi multipli a bagno d'olio ad apertura idraulica.

Freni negativi

Questi freni agiscono sotto la spinta di una serie di molle su coppie di dischi alternati fissi e mobili; lo sbloccaggio avviene per effetto della pressione idraulica nel pistone. Hanno quindi un funzionamento "negativo"; sono da impiegare come freni di stazionamento, non per frenatura dinamica. Tali prestazioni, con margine di accuratezza +/- 10%. sono sempre calcolate con contropressione 0; in caso contrario la coppia frenante viene percentualmente ridotta nel rapporto contropressione/pressione min. apertura. Per la selezione, occorre tenere conto di due condizioni:

- 1) Coppia freno $\times i_{\text{eff}}$ > Coppia richiesta in uscita;
- 2) Coppia freno $\times i_{\text{eff}} < 1.1 T_{2\max}$

Ricordiamo che le alte velocità di rotazione, oppure prolungati funzionamenti con asse verticale, possono generare elevati aumenti di temperatura: in questi casi, contattare il referente DANA di zona per opportuni consigli in merito. Per la lubrificazione, si consigliano oli minerali resistenti al calore ed all'invecchiamento, di viscosità ISO VG 32. indice di viscosità pari o superiore a 95.

10. MULTIDISC BRAKES IN OIL

The gear units in this catalogue can be supplied with multidisc brakes, in oil, hydraulically released.

Negative brakes

These brakes are actuated by a series of coil springs pressing together alternate fixed and rotating discs. The braking torque is released by mean of an hydraulic pressure supplied from outside. This means that they work as "negative" brakes and are intended for safety or parking only, when the input shaft is not rotating. These performances, with +/- 10% accuracy margins, are always calculated without back pressure; otherwise the braking torque is reduced as a percentage of the ratio back pressure/minimum opening pressure. When carrying out the selection, the following two conditions must be taken into account:

- 1) Braking torque $\times i_{\text{eff}}$ > required output torque;

- 2) Braking torque $\times i_{\text{eff}} < 1.1 T_{2\max}$

We remind you that high rotation speed, or extended running with vertical axis, can generate considerable temperature increases; consult the DANA area contact person. For lubrication we recommend to use mineral oils heat and aging resistant, having viscosity ISO VG 32 and viscosity index at least 95.

10. LAMELLENBREM- SEN IM ÖLBAD

Die Getriebe des vorliegenden Katalogs können mit im Ölbad laufenden Lamellenbremsen mit hydraulischer Spreizung ausgestattet werden.

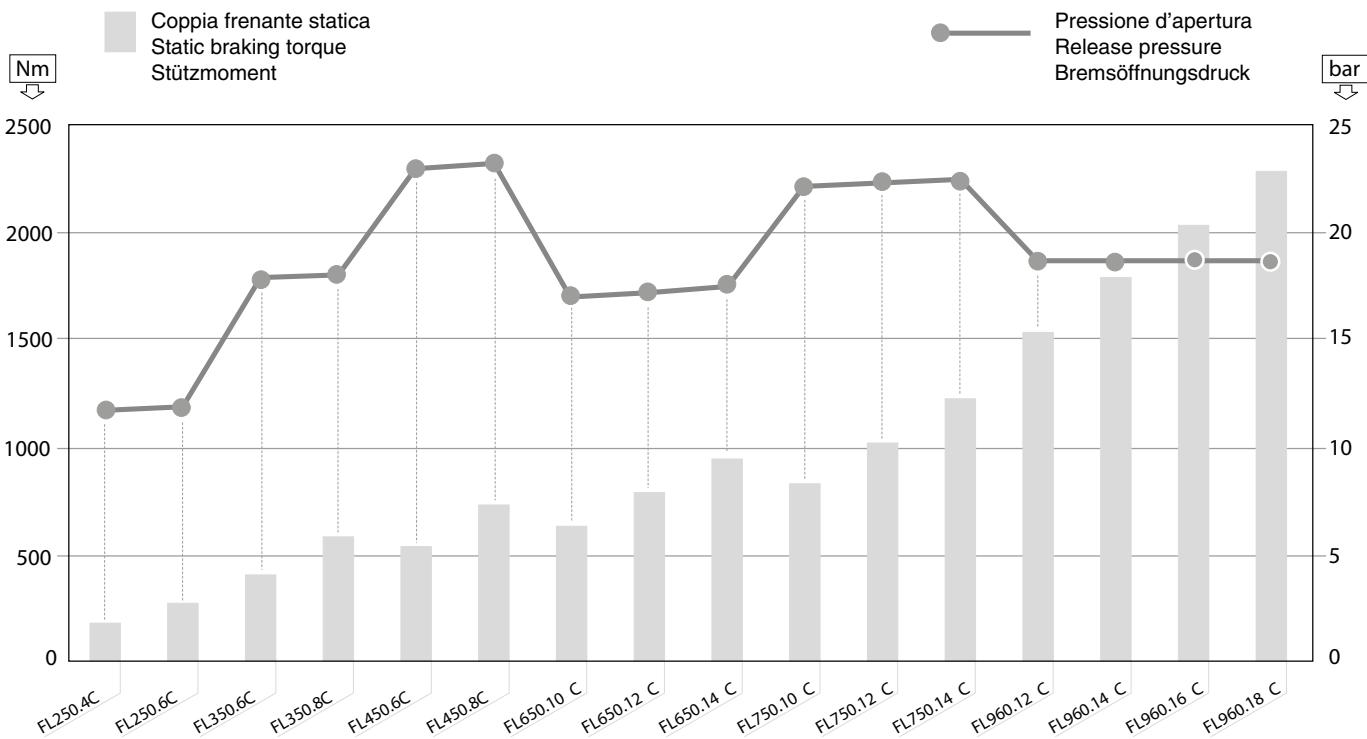

Negative Bremsen

Die Bremsen wirken unter dem Druck einer Reihe von Federn auf abwechselnd fixe und bewegliche Scheibenpaare; das Lösen der Bremse erfolgt durch den hydraulischen Druck im Kolben. Sie haben demnach eine "negative" Funktion; sie werden als Feststellbremsen benutzt und dienen nicht zum dynamischen Abbremsen. Diese Leistungen werden bei einer Genauigkeitsmarge von +/- 10% mit einem Gegendruck von 0 berechnet; anderenfalls wird das Bremsmoment proportional im Verhältnis Gegendruck/Mindestöffnungsdruck reduziert. Bei der Auswahl sind zwei Bedingungen zu berücksichtigen:

- 1) Bremsmoment $\times i_{\text{eff}}$ > erforderliches Abtriebsdrehmoment;

- 2) Bremsmoment $\times i_{\text{eff}} < 1.1 T_{2\max}$

Es wird daran erinnert, dass hohe Drehzahlen oder lange Betriebszeiten mit vertikaler Achse zu starken Temperaturerhöhungen führen können: Wir empfehlen Ihnen, Sich an die DANA Kontaktperson der zone zu wenden. Zur Schmierung sollten wärme- und alterungsbeständige Mineralöle mit Viskosität ISO VG 32 verwendet werden (Viskositätsindex gleich oder höher als 95).

10.FREINS A LAMELLES IMMERGÉES

Les réducteurs de ce catalogue peuvent être dotés en entrée d'un frein à lamelles immergées à commande hydraulique.

Freins négatifs

Ces freins agissent sous la poussée d'une série de ressorts sur des paires de disques alternés fixes et mobiles; le déblocage s'effectue par l'action de la pression hydraulique dans le piston. Ils ont donc un fonctionnement "négatif"; ils doivent être utilisés comme frein de stationnement et non pas pour le freinage dynamique. Ces performances, avec un marge de +/- 10%, sont toujours calculées en tenant compte d'une contre-pression 0; dans le cas contraire, le couple de freinage est proportionnellement réduit dans le rapport contre-pression/pression mini d'ouverture. Pour la sélection, il faut tenir compte de deux conditions:

- 1) Couple de freinage $x i_{eff} >$ Couple requis en sortie;
 - 2) Couple de freinage $x i_{eff} < 1.1 T_{2max}$
- Noter que les vitesses de rotation élevées, ainsi que le fonctionnement prolongé avec l'axe vertical, peuvent entraîner des élévations de température: nous vous recommandons de consulter la personne de référence de la zone DANA. Pour la lubrification, nous conseillons des huiles minérales résistantes à la chaleur et au vieillissement, ayant une viscosité ISO VG 32, indice de viscosité égal ou supérieur à 95.

10.FRENOS LAMINARES EN BAÑO DE ACEITE

En la entrada de los reductores de este catálogo se pueden montar discos múltiples en baño de aceite con apertura hidráulica.

Frenos negativos

Estos frenos son accionados por una serie de muelas que comprimen pares de discos fijos y móviles alternados; el desbloqueo se produce por efecto de la presión hidráulica sobre el pistón. Por ello se habla de funcionamiento "negativo"; se emplean como frenos de estacionamiento, no para el frenado dinámico. El intervalo de tolerancia es de +/- 10% y se calcula siempre con contrapresión 0; de lo contrario el par de frenado de la relación contrapresión/presión mín de apertura se reduce. Antes de la selección hay que tomar en cuenta dos factores:

1) Par freno $x i_{eff} >$ Par de salida necesario;

2) Par freno $x i_{eff} < 1.1 T_{2max}$

Si el reducotor trabaja demasiado tiempo en posición vertical o con velocidades grandes puede registrarse un aumento significativo de la temperatura: le recomendamos que consulte a la persona de contacto del área de DANA.

Lubricar con aceites minerales resistentes al calor y al envejecimiento con viscosidad ISO VG 32 y un índice de viscosidad igual o mayor que 95.

10.FREIOS LAMELARES A BANHO DE ÓLEO

Os redutores deste catálogo podem ser dotados, na entrada, de freio a discos múltiplos a banho de óleo com abertura hidráulica.

Freios negativos

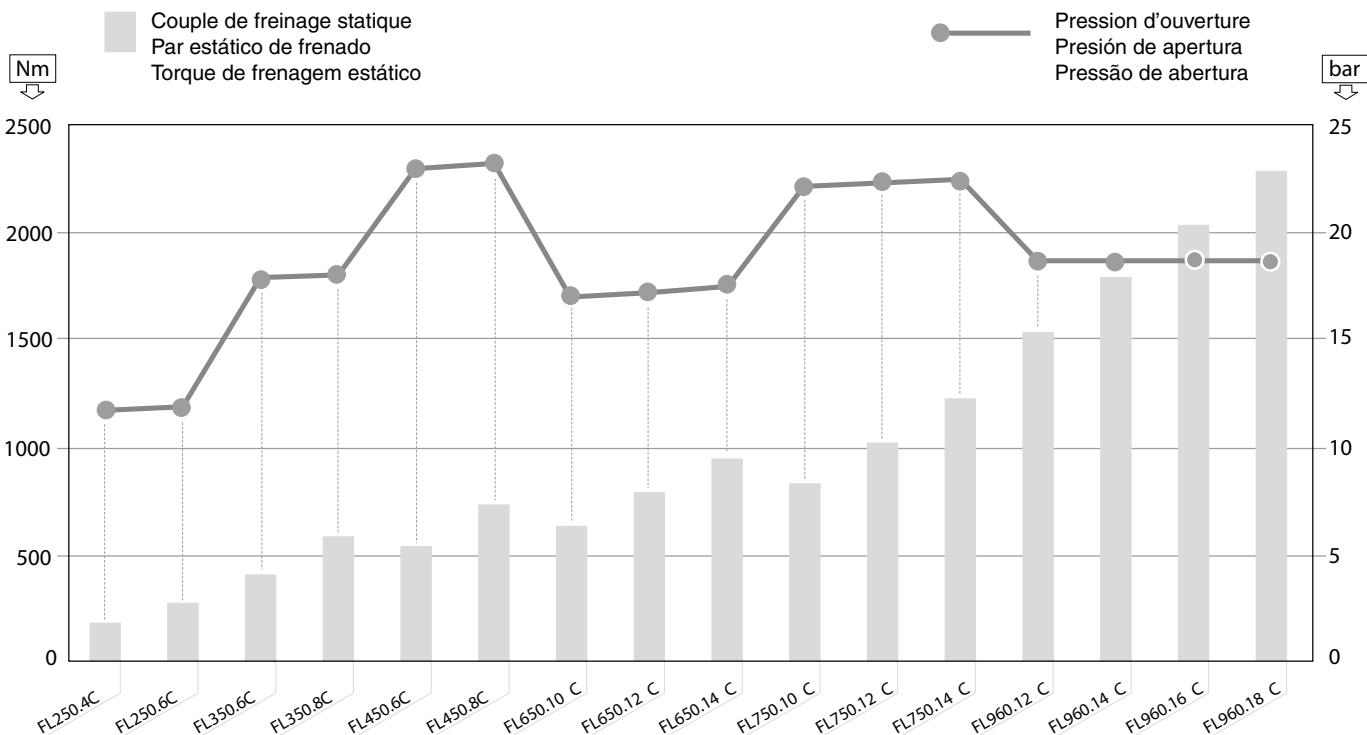

Esses freios agem sob a pressão de uma série de molas em pares de discos alternados, fixos e móveis; o desbloqueio ocorre por efeito da pressão hidráulica no pistão. Têm, portanto, um funcionamento "negativo"; devem ser empregados como freios de estacionamento, não para frenagem dinâmica. Tais desempenhos, com margem de precisão de +/- 10% são sempre calculados com contrapressão 0, caso contrário o torque de frenagem é porcentualmente reduzido na relação contrapressão/pressão mín. de abertura. Para a seleção, é necessário levar em consideração duas condições:

1) Torque do freio $x i_{eff} >$ Torque necessário na saída;

2) Torque do freio $x i_{eff} < 1.1 T_{2max}$

Recordamos que as altas velocidades de rotação ou períodos de funcionamento prolongados com eixo vertical podem gerar grandes aumentos de temperatura: recomendamos que você consulte seu contato local da DANA.

Para a lubrificação, são aconselháveis óleos minerais resistentes ao calor e ao envelhecimento, com viscosidade ISO VG 32, índice de viscosidade igual ou superior a 95.

11. ENTRATE UNIVERSALI

L'entrata universale è una configurazione che, montata in ingresso ai riduttori, permette di accoppiare le più diverse tipologie di motorizzazioni tramite una flangia e un manicotto di adattamento appositi. Esistono due diverse dimensioni di entrata universale in funzione delle grandezze montate come stadio in ingresso sui riduttori.

Questa configurazione è possibile anche quando il riduttore sia dotato in entrata di freno lamellare.

L'applicabilità può essere dedotta dalle tavole dimensionali.

11. UNIVERSAL INPUTS

The universal input is a configuration mounted on the gear unit input, enabling the coupling of many types of motorizations by means of a special flange and adapter coupling.

Two different universal input sizes are available according to the sizes mounted as input stage on the gear units.

The universal input configuration can be used whether an external lamellar brake is fitted to the gearbox input.

Applicability can be obtained from the dimensional tables.

11. UNIVERSAL-ANTRIEBE

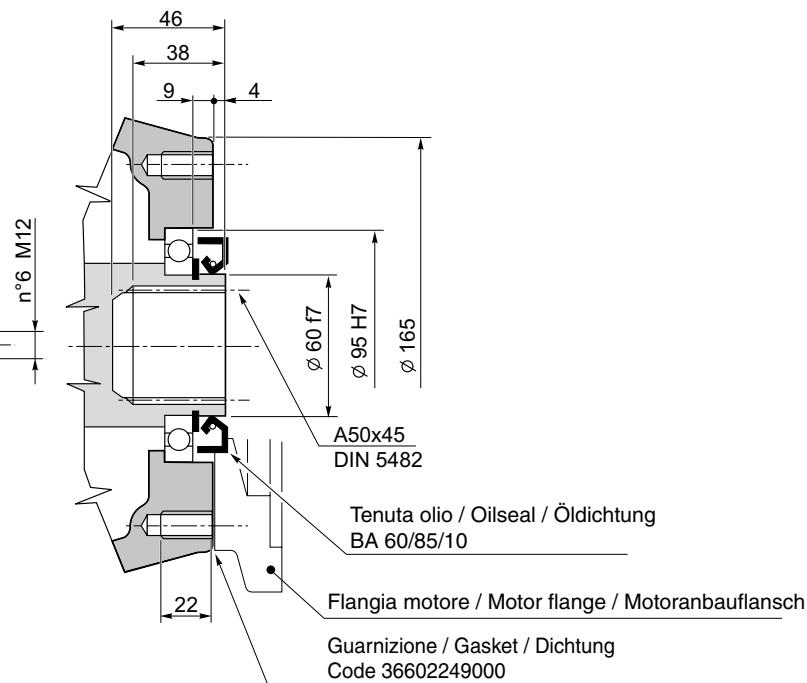

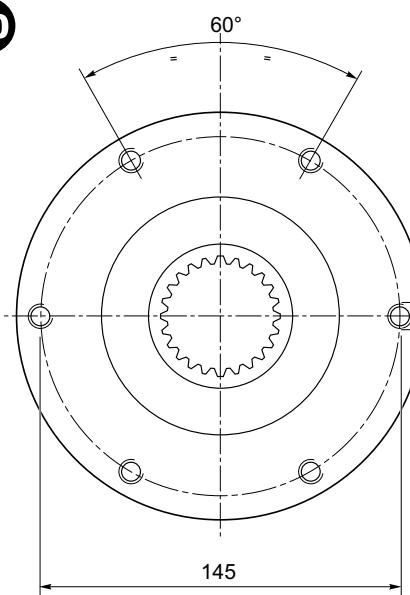

Der Universalantrieb ist eine Anordnung, die am Getriebeeingang montiert wird und die ermöglicht, die unterschiedlichsten Motortypen mithilfe eines Flansches oder einer Adapterhülse anzukoppeln.

Je nach der auf den Getrieben montierten Antriebsstufen stehen zwei verschiedene Größen des Universalantriebs zur Verfügung.

Konfiguration ist anwendbar, unabhängig davon, ob das Getriebe am Eingang mit einer Lamellenbremse ausgestattet ist.

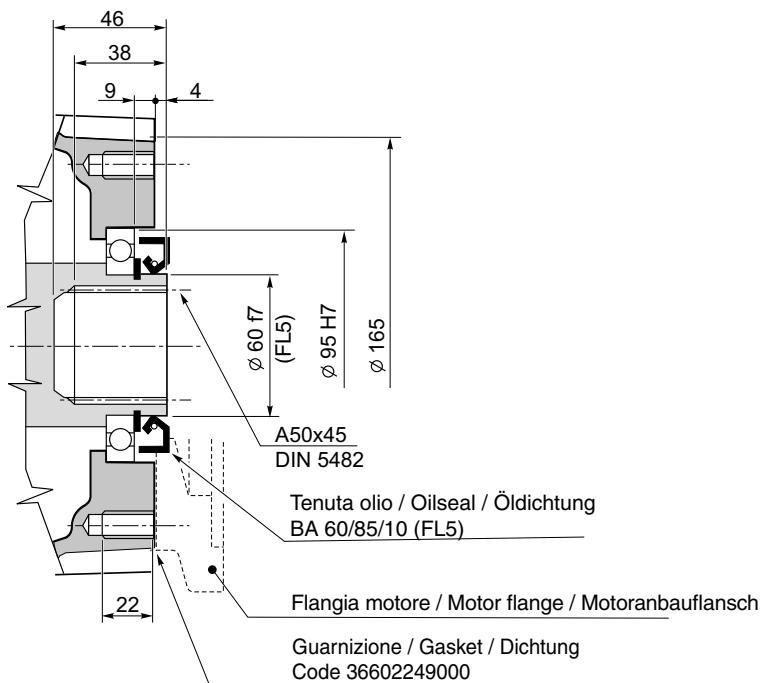

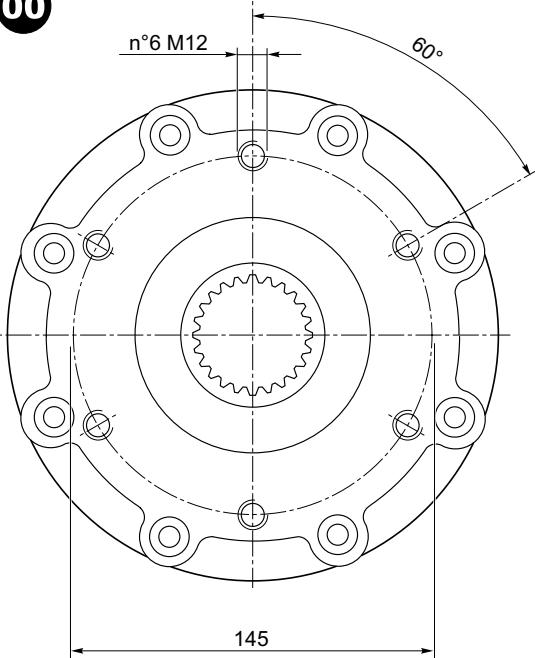

Die Eignung kann den Maßbildern entnommen werden.

00

00

Per freno / For brake / Für brese

11. PREDISPOSITIONS D'ENTREE

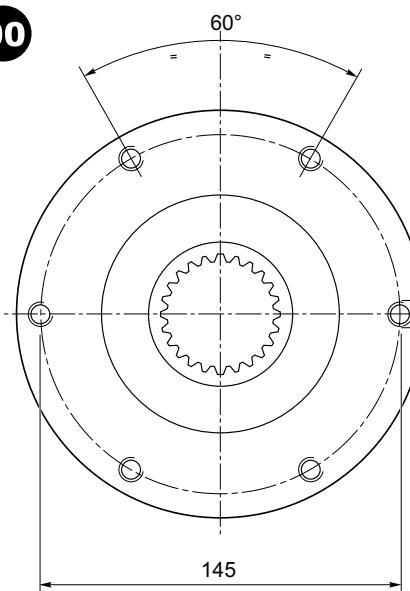

La prédisposition d'entrée universelle est une configuration qui, montée en entrée aux réducteurs, permet d'accoupler les différents types de moteurs par un flasque-bride et un manchon ou moyeu d'adaptation appropriés.

Il existe deux différentes dimensions de prédispositions d'entrée universelles en fonction des grandeurs montées comme étage en entrée, sur les réducteurs.

Cette configuration est possible également quand le réducteur est doté d'une entrée de frein lamellaire externe.

L'adaptabilité peut être tirée des planches des dimensions d'encombrement.

00

11. ENTRADAS UNIVERSALES

La entrada universal es una configuración que permite acoplar todo tipo de motores por medio de una brida y un manguito adaptador especiales.

Dependiendo del tamaño elegido para la entrada del reductor puede haber dos medidas de entrada universal.

Se puede realizar independientemente de que en la entrada del reductor haya un freno laminar exterior.

Las posibilidades de aplicación se deducen de los diseños dimensionales.

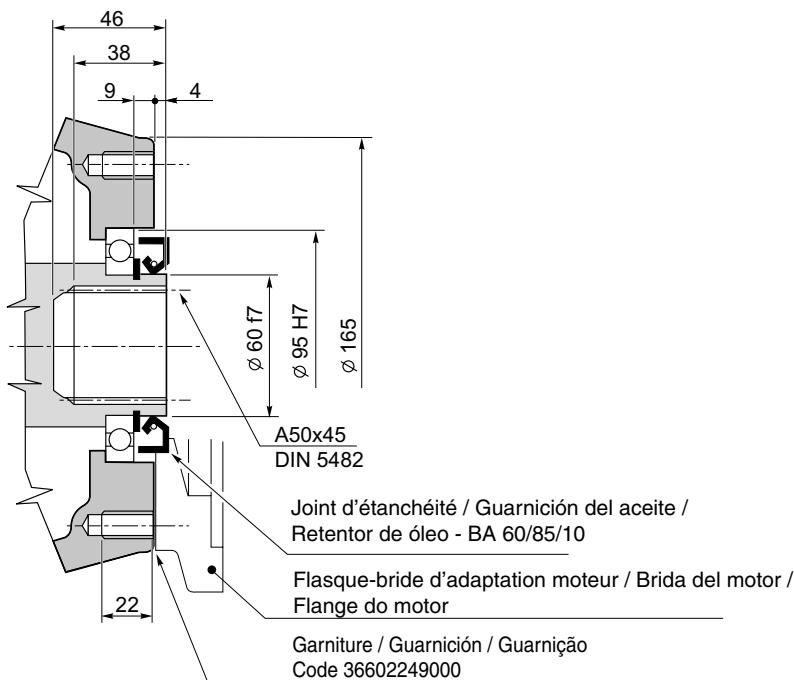

11. ENTRADAS UNIVERSAIS

A entrada universal é uma configuração que, montada na entrada dos redutores, permite acoplar os mais diversos tipos de motores através de um flange e uma luva de adaptação adequados.

Existem duas dimensões de entrada universal diferentes em função dos tamanhos montados como estágio na entrada dos redutores.

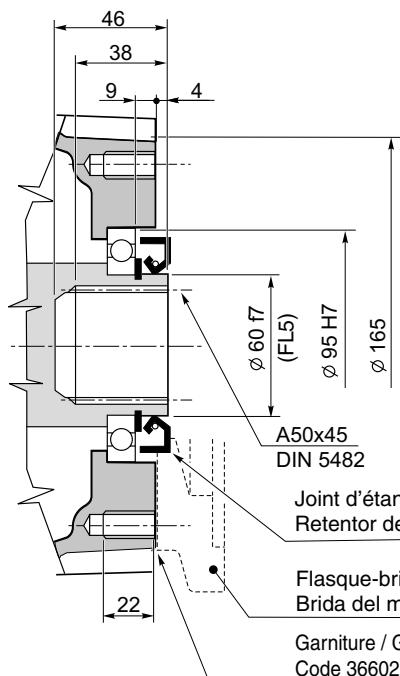

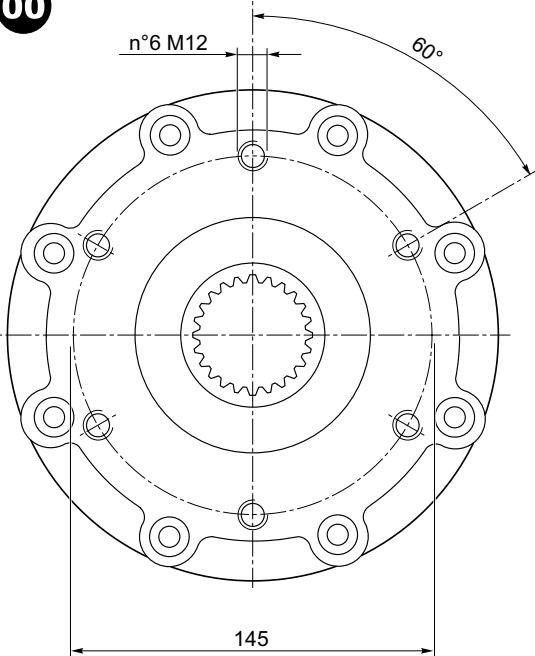

Essa configuração é possível mesmo quando o redutor é dotado, na entrada, de freio lamelar externo.

A aplicabilidade pode ser deduzida através das tabelas dimensionais.

Dimensiones en pulgadas

Dimensões em polegadas

Aux flasques - brides indiquées dans le tableau viennent s'ajouter d'autres modèles sur demande.

Además de las bridás indicadas en la tabla, DANA puede suministrar otros modelos diferentes bajo a pedido.

Além dos flanges indicados na tabela, estão disponíveis outros modelos diferentes abaixo a pedido.

13. STATO DI FORNITURA

I riduttori sono verniciati esternamente con fondo epossidico sintetico blu "RAL 5012", salvo di verse disposizioni contrattuali. La protezione è idonea a resistere a normali ambienti industriali anche esterni e consente ulteriori finiture con vernici sintetiche.

Nel caso si prevedano particolari condizioni ambientali aggressive, bisogna utilizzare delle verniciature speciali.

Le parti esterne lavorate del riduttore come le estremità degli alberi cavi e non, piani di appoggio, centraggi ecc. vengono protetti con olio (tectyl) antiossidante. Le parti interne delle casse dei riduttori sono vernicate con vernice antiolio e i cinematicismi sono protetti con olio antiossidante.

Tutti i riduttori, salvo diverse indicazioni contrattuali, **vengono forniti senza lubrificazione**: come indicato da un'apposita etichetta adesiva allegata al riduttore stesso per evidenziarne lo stato.

I prodotti DANA vengono imballati e spediti, secondo i casi, in casse o su pallets. Tutti i prodotti DANA, salvo diverse indicazioni contrattuali, **vengono imballati con imballi idonei per resistere a normali ambienti industriali**.

Ogni riduttore DANA viene fornito con specifico manuale di "Installazione e Manutenzione". Dichiarazione del fabbricante e l'attestato di Conformità – UNI EM10204-2.1.

13. SUPPLY CONDITION

The gear units are painted externally with synthetic primer in blue "RAL 5012", unless otherwise specified in the contract. The protection is suitable for withstanding normal industrial environments (also external) and can be finished with synthetic paints. If particular aggressive ambient conditions are foreseen, special painting is required.

The worked external parts of the gear unit, such as the ends of the hollow and solid shafts, support tables, centerings, etc., must be protected with antioxidant oil (tectyl). The parts inside the gear unit casings are painted with oil-proof paint and the kinematic mechanisms are protected with antioxidant oil. Unless otherwise specified in the contract, **all the gear units are supplied without lubrication**: as specified by a special sticker placed on the unit for indicating its condition.

DANA products are packed and shipped in boxes or on pallets, as required. Unless otherwise specified in the contract, **all DANA products are packed with packing suitable for withstanding normal industrial environments**.

Every DANA gear unit comes with a specific "Installation and Maintenance" manual. Manufacturer's declaration and certificate of Conformity - UNI EM10204-2.1.

13. LIEFERBEDING-UNGEN

Die Außenseite der Getriebe ist mit Epoxidharz blau "RAL 5012" lackiert, soweit vertraglich nicht anders vereinbart. Der Schutz ist für normale Industrieumgebungen und Außenbereiche geeignet und gestattet zusätzliche Überlackierung mit Synthetiklacken. Bei Einsatz unter besonders aggressiven Umgebungsbedingungen müssen Speziallacke verwendet werden.

Die bearbeiteten Außenteile des Getriebes wie die Stümpfe der Hohlwellen und Wellen, Stützflächen, Zentrieransätze usw. werden mit einem Film oxidationshemmenden Öls (Tectyl) geschützt. Die Innenteile der Getriebegehäuse werden mit schmierölfesten Lacken lackiert und die Getriebe sind durch oxidationshemmendes Öl geschützt.

Alle Getriebe, soweit vertraglich nicht anders vereinbart, **werden ohne Schmieröl geliefert**: ein Aufkleber auf dem Getriebe weist auf den Zustand desselben hin.

Die Produkte DANA werden in Kisten oder auf Paletten geliefert und versandt. Alle Produkte DANA, soweit vertraglich nicht anders vereinbart, **werden in Verpackungen geliefert, die für normale Industrieumgebungen ausreichend sind**. **Alle Getriebe DANA sind mit einem spezifischen "Installations- und Wartungshandbuch", mit Herstellererklärung und Konformitätsbescheinigung – UNI EM10204-2.1 versehen**.

14. CONDIZIONI DI STOCCAGGIO

Nel caso occorra immagazzinare il prodotto per un periodo superiore ai 2 mesi attenersi a quanto segue:

Proteggere gli alberi e i centraggi con pellicola di grasso e/o liquidi protettivi anticorrosione.

Riempire totalmente il riduttore e l'eventuale freno lamellare con oli adeguati.

Immagazzinare in luogo asciutto e con temperatura compresa fra i -5 °C e +30 °C.

Proteggere i colli dallo sporco, dalla polvere e dall'umidità.

Per immagazzinamento prolungato oltre i 6 mesi decade l'efficienza per le tenute rotanti. Si consiglia un controllo periodico facendo ruotare gli ingranaggi interni a mano ruotando l'albero in entrata, in presenza di freno lamellare negativo, bisogna sbloccare il freno, con pompa idraulica o similare (per pressione di apertura freno vedi capitolo freni). L'eventuale sostituzione all'atto del l'avviamento delle guarnizioni è consigliata.

14. STORING CONDITIONS

If the product is to be stored for more than 2 months, carry out as follows:
Protect the shafts and centerings with a film of grease and/or anticorrosive protection liquids.

Completely fill the gear unit and possible multidisc brake with suitable oils.

Store in a dry place with temperature of between -5 °C and +30 °C.

Protect the packages from dirt, dust and damp.

When storing for more than 6 months the rotating seals will lose efficiency.

It is advisable to carry out a periodical check, manually turning the internal gears, turning the input shaft; with negative multidisc brake, release the brake, with hydraulic pump or similar (for brake release pressure see the chapter Brakes). Possible replacement of the gaskets on starting is advisable.

14. LAGERBEDING-UNGEN

Gehen Sie bei einer Lagerung des Produktes für einen Zeitraum von mehr als 2 Monaten wie folgt vor:

Schützen Sie die Wellen und die Zentrieransätze mit einer dünnen Fettschicht und/oder Rostschutzmitteln.

Füllen Sie das Getriebe und die eventuelle Lamellenbremse ganz mit den empfohlenen Ölsorten. Lagern Sie die Getriebe an einem trockenen Ort mit einer Temperatur von -5 °C bis +30 °C.

Schützen Sie die Ware vor Schmutz, Staub und Feuchtigkeit.

Bei Lagerung von mehr als 6 Monaten verlieren die Wellendichtungen ihre Wirksamkeit. Überprüfen Sie regelmäßig die Getriebe, indem Sie die Zahnräder von Hand mithilfe der Antriebswelle drehen; sollte eine Lamellenbremse eingebaut sein, muss die Bremse mit einer Hydraulikpumpe oder ähnlichem freigesetzt werden (für den Öffnungsdruck der Bremse siehe das Kapitel Bremsen). Bei der Inbetriebnahme sollte die Dichtung möglichst ersetzt werden.

13. ETAT DE LA FOURNITURE

Les réducteurs sont peints extérieurement par application d'un apprêt époxydique synthétique bleu "RAL 5012", sauf dispositions contractuelles contraires. La protection est prévue pour résister aux environnements industriels normaux, même extérieurs, et permet l'application de couches de finitions de peintures synthétiques. Dans le cas d'utilisation dans des particulières conditions d'ambiance agressives, il faut utiliser des peintures spéciales. Les parties extérieures usinées du réducteur, comme par exemple les bouts d'arbres creux et non, les plans d'appui, centrages, etc., doivent être protégés avec de l'huile (tectyl) antioxydante. Les parties intérieures des carcasses (autrement dit carters) des réducteurs sont revêtues d'une peinture anti-huile et les cinématismes sont protégés avec de l'huile antioxydante.

Tous les réducteurs, sauf dispositions contractuelles contraires, **sont livrés sans lubrification:** comme spécifié sur une étiquette autocollante jointe avec le réducteur pour signaler cette condition.

Les produits DANA sont emballés et expédiés, suivant les cas, dans des caisses ou sur palettes. Tous les produits DANA, sauf dispositions contractuelles contraires, **sont conditionnés dans des emballages prévus pour résister aux ambiances industrielles normales.**

Chaque réducteur DANA est accompagné d'un manuel d'Installation et d'Entretien spécifique. Déclaration du fabricant et certificat de conformité – UNI EM10204-2.1.

14. CONDITIONS DE STOCKAGE

Dans le cas d'emmagasinage du produit pour une période de temps supérieure à 2 mois, respecter les points suivants:

Protéger les arbres et les centrages avec un film de graisse et/ou de liquides de protection anticorrosion.

Remplir entièrement le réducteur et le frein à lamelles éventuelles avec des huiles appropriées.

Stocker en un lieu sec et avec une température comprise entre -5 °C et +30 °C. Protéger les colis contre la saleté, la poussière et l'humidité.

Pour le stockage au-delà des 6 mois, l'efficacité des joints rotatifs se dégrade. Il est conseillé d'effectuer un contrôle périodique en faisant tourner les engrenages internes à la main en tournant l'arbre en entrée; en présence d'un frein à lamelles négatif, il faut le débloquer le frein avec une pompe hydraulique ou un matériel similaire (pour la pression d'ouverture du frein, voir chapitre freins). Le remplacement éventuel, au moment du démarrage, des joints est conseillé.

13. CONFIGURACIÓN DE ENTREGA

Salvo cuando el contrato estipula lo contrario, los reductores están barnizados por fuera con una base epoxídica sintética azul "RAL 5012". Esta protección es idónea para instalaciones industriales bajo techo y a la intemperie y admite el acabado con barnices sintéticos. Si las condiciones ambientales son particularmente agresivas hay que utilizar barnices especiales.

Las partes externas mecanizadas del reductor (extremos de los ejes huecos y macizos, planos de apoyo, centrados, etc.) se protegen con aceite antioxidante (tectyl). Las carcasa de los reductores están barnizadas por dentro con barniz impermeable al aceite. Los mecanismos están protegidos con aceite antioxidante.

Salvo cuando el contrato estipula lo contrario, todos los reductores DANA se entregan sin lubricantes: así lo indica la descripción del estado que figura en la etiqueta adhesiva del reductor.

Los productos de DANA se envían embalados en cajones o en paletas, según los casos.

Salvo cuando el contrato estipula lo contrario, los productos DANA **se los materiales de los embalajes son aptos para ambientes industriales normales.** Cada reductor DANA se entrega con un manual de instalación y mantenimiento. Declaración del fabricante y certificado del Conformidad – UNI EM10204-2.1.

14. CONDICIONES DE ALMACENAJE

Si el producto debe permanecer almacenado más de dos meses:

Proteger los ejes y los centrados con una película de grasa o un líquido anticorrosión.

Llenar el reductor y eventualmente el freno laminar con aceites adecuados.

Almacenar en un sitio seco a una temperatura de -5 a +30 °C.

Proteger los bultos de la suciedad, el polvo y la humedad.

Si el almacenaje se prolonga más de seis meses las garniciones giratorias pierden eficiencia. Se aconseja revisarlas periódicamente girando a mano los engranajes interiores y el eje de entrada. Si se observa freno negativo hay que desbloquear el freno con una bomba hidráulica o similar (la presión de apertura está indicada en el capítulo dedicado a los frenos) y sustituir las garniciones giratorias antes de utilizarlas por primera vez.

13. CONDIÇÃO DE FORNECIMENTO

Os redutores são pintados externamente com base epóxi sintética azul "RAL 5012", salvo disposições contratuais diferentes. A proteção é adequada para resistir a ambientes industriais normais, também externos, e permite acabamentos posteriores com tintas sintéticas.

Caso sejam previstas condições ambientais particularmente agressivas, será necessário utilizar tintas especiais.

As partes externas trabalhadas do reductor, como as extremidades dos eixos ocos e não ocos, planos de apoio, centragens, etc. são protegidas com óleo (tectyl) antioxidante. As partes internas das carcaças dos redutores são pintadas com tinta antióleo e os mecanismos cinematográficos são protegidos com óleo antioxidante.

Todos os redutores, salvo outra indicação contratual, **são fornecidos sem lubrificação:** como indicado em uma etiqueta adesiva apropriada fixada ao próprio reductor para evidenciar sua condição.

Os produtos DANA são embalados e expedidos, conforme os casos, em caixas ou sobre paletes. Todos os produtos DANA, salvo indicações contratuais diferentes, **são embalados com embalagens idóneas para resistir a ambientes industriais normais.**

Cada reductor DANA é fornecido com um manual de "Instalação e manutenção" específico. Declaração do fabricante e atestado de Conformidade – UNI EM10204-2.1.

14. CONDIÇÕES DE ARMAZENAGEM

Caso seja necessário armazenar o produto por um período superior a 2 meses, limitar-se ao que segue:

Proteger os eixos e as centragens com uma película de graxa e/ou líquidos de proteção anticorrosão. Encher totalmente o reductor e o freio lamelar eventual com óleos adequados.

Armazenar em local seco e com temperatura entre -5 °C e +30 °C.

Proteger os volumes contra sujeira, poeira e umidade.

A eficiência dos retentores giratórios cai no caso de um armazenamento prolongado por mais de 6 meses. É aconselhável um controle periódico girando manualmente as engrenagens internas, girando o eixo na entrada; na presença de freio lamelar negativo, é necessário desbloquear o freio com bomba hidráulica ou similar (para a pressão de abertura do freio, consultar o capítulo Freios). É aconselhável a eventual substituição das garnições no momento da partida.

15. INSTALLAZIONE

L'installazione dei riduttori deve essere realizzata con cura e professionalità impiegando personale adeguatamente istruito e tecnicamente preparato.

La predisposizione al funzionamento deve avvenire rispettando tutte le indicazioni tecniche contenute rispettando tutte le indicazioni tecniche contenute nei relativi documenti.

Le strutture a cui vanno fissati devono essere rigide, con superfici di appoggio lavorate a macchina ben piane e prive di verniciatura, normali all'asse azionato, e con centraggi a tolleranza H8; Le superfici a contatto debbono essere preventivamente sgrassate in modo perfetto.

Deve essere curato l'allineamento tra il riduttore e l'albero da comandare, soprattutto nel caso di riduttori con uscita femmina scanalata che, ricordiamo, non accettano carichi esterni; Per il fissaggio devono essere impiegate viti di classe minima 10.9 con serraggio al 75% dello snervamento.

Durante il montaggio debbono essere assolutamente evitati urti assiali violenti che potrebbero danneggiare i cuscinetti interni Gli organi di comando da calettare sull'albero cilindrico in uscita devono essere lavorati come da indicazioni riportate nel capitolo: "Configurazioni uscite".

Quindi nel collegamento tra riduttore e motore si consiglia l'utilizzo di giunti in grado di recuperare disallineamento, mentre se si utilizzano organi meccanici non in grado di recuperare disallineamento, all'atto del montaggio porre molta attenzione all'allineamento fra riduttore e motore.

15. INSTALLATION

The gear units must be carefully installed by suitably trained technical personnel. Preparation for operation must occur according to all technical information contained in relevant documents.

The structures to which they are fixed must be rigid, with perfectly flat machined unpainted support surfaces, normal with driven shaft, and with centerings to tolerance H8.

The contact surfaces must be duly and perfectly greased.

The unit must be carefully aligned with the driven shaft, especially with gear units with female splined output shaft which, it must be remembered, do not take external loads.

For fixing, use screws of class min. 10.9 with tightening at 75% yielding.

During assembly, violent axial impacts must absolutely be avoided since they could damage the internal bearings. The control parts to be fitted on the cylindrical output shaft must be worked according to the specifications given in the chapter: "Output configurations".

We are therefore recommending to use couplings that can recover misalignment when connecting gearbox and motor. In case of use of mechanical components that do not allow misalignment recovering, please pay special care to the alignment between gearbox and motor during assembling operations.

15. INSTALLATION

Die Installation der Getriebe muss sorgfältig und professionell durch technisch ausgebildete Fachkräfte ausgeführt werden.

Die Vorbereitung zur Inbetriebnahme muss entsprechend gemäß allen technischen Angaben der spezifischen Unterlagen.

Sie dürfen nur an starren Strukturen befestigt werden mit ebenen maschinenbearbeiteten unlackierten Auflageflächen, gewöhnlich an der angetriebenen Achse und mit Zentrieransätzen mit Toleranz H8; Die Kontaktflächen müssen zuvor sorgfältig entfettet werden.

Die Ausrichtung zwischen Getriebe und angetriebener Welle ist äußerst sorgfältig vorzunehmen, besonders bei Hohlwellen mit Keilnut, die, wie bekannt ist, keinen externen Belastungen ausgesetzt werden dürfen;

Für die Befestigung sind Schrauben mit Mindestklasse 10.9 und Anziehmoment von 75% der Streckgrenze zu verwenden.

Bei der Montage sind unbedingt heftige Stöße gegen die Achsen zu vermeiden, durch die die inneren Lager beschädigt werden können.

Die Organe, die auf die zylindrische Abtriebswelle aufgezogen werden, müssen entsprechend den Anweisungen im Kapitel: "Konfigurationen Abtriebe" bearbeitet werden.

Wir empfehlen Motor und Getriebe durch Kupplungen zu verbinden, die die Fluchtabweichung aufheben können. Falls mechanische Teile ohne Beseitigung der Fluchtabweichung verwendet werden, muss bei der Montage die Ausrichtung zwischen Getriebe und Motor beachtet werden.

15. INSTALLATION

L'installation des réducteurs doit être effectuée par un professionnel qualifié et expressément habilité à réaliser cette opération.

La prédisposition au fonctionnement doit se faire en suivant toutes les indications techniques contenues dans les documents correspondants.

Les structures auxquelles sont fixés les réducteurs doivent être rigides, présentées des surfaces ou portées usinées parfaitement plane et nues (sans peinture), normales à l'arbre entraîné et des centrauges avec une tolérance H8;

Les surfaces de contact doivent être préalablement dégraissées minutieusement.

Il faut prêter une attention particulière à l'alignement entre le réducteur et l'arbre à commander, notamment dans le cas de réducteurs avec sortie femelle cannelée qui, faut-il le rappeler, ne supportent pas de charges externes; Pour la fixation, il faut impérativement utiliser des vis de classe 10.9 minimum serrées à 75% de la limite d'élasticité.

Lors du montage, il faut absolument éviter tous chocs axiaux violents qui pourraient endommager les roulements internes.

Les organes de commande à assembler sur l'arbre cylindrique en sortie doivent être usinés en respectant les prescriptions indiquées dans le chapitre : "Configurations des sorties".

Pour le raccordement entre le réducteur et le moteur, on conseille donc d'utiliser des joints en mesure de récupérer le désalignement, alors que si on utilise des organes mécaniques pas en mesure de récupérer le désalignement, au moment du montage faire très attention à l'alignement entre le réducteur et le moteur.

15. INSTALACIÓN

Los reductores deben ser instalados por técnicos profesionales competentes y expertos.

Al prepararlos para funcionar es preciso respetar todas las indicaciones técnicas contenidas en los relativos documentos.

Fijar el reductor en estructuras rígidas con superficies de apoyo mecanizadas muy planas y sin barnizar, perpendiculares al eje accionado (tolerancia de centraje H8);

Antes de comenzar hay que desengrasar cuidadosamente las superficies de contacto.

Mantener el reductor bien alineado al eje sobre todo si la salida hembra es acanalada porque, como se recordará, estas salidas no aceptan cargas externas.

Los tornillos de fijación deben ser como mínimo de 10.9 y estar apretados al 75%.

Durante el montaje hay que evitar los choques axiales violentos porque pueden dañar los rodamientos interiores.

Los órganos de mando que se ensamblan en el eje cilíndrico de salida deben estar mecanizados como se describe en el capítulo "Configuración de las salidas".

Por ello, en la conexión entre el reductor y el motor se recomienda el uso de uniones capaces de recuperar desalineaciones, mientras que si se usan órganos mecánicos que no sean capaces de recuperar desalineaciones, durante el montaje prestar mucha atención a la alineación entre el reductor y el motor.

15. INSTALAÇÃO

A instalação dos redutores deve ser realizada com cuidado e profissionalismo, empregando pessoal instruído de forma adequada e tecnicamente preparado.

A predisposição para o funcionamento deve ser efetuada respeitando todas as indicações técnicas contidas nos relativos documentos.

As estruturas às quais serão fixados devem ser rígidas, com superfícies de apoio acabadas a máquina, bem planas e isentas de tinta, perpendiculares ao eixo acionado e com centragens de tolerância H8;

As superfícies de contato devem ser desengraxadas preventivamente de modo perfeito.

O alinhamento entre o redutor e o eixo a ser operado deve ser observado, sobretudo no caso de redutores com saída fêmea ranhurada que, lembramos, não aceitam cargas externas; Para a fixação devem ser empregados parafusos com classe mínima de 10.9 com aperto até 75% do limite elástico.

Durante a montagem devem ser absolutamente evitados os impactos axiais violentos que podem danificar os coxins internos.

Os órgãos de comando a serem alinhados ao eixo cilíndrico na saída devem ser trabalhados como indicado no capítulo: "Configurações de saída".

Portanto, na ligação entre o redutor e o motor, aconselha-se a utilizar um acoplamento que consiga compensar o desalinhamento. Por outro lado, se forem utilizados órgãos mecânicos não capazes de compensar o desalinhamento, na altura da montagem será preciso prestar muita atenção ao alinhamento entre o redutor e o motor.

17. LUBRIFICAZIONE

I riduttori DANA vengono forniti privi di lubrificante; l'utilizzatore è tenuto ad effettuare il corretto riempimento prima della messa in moto della macchina.

Caratteristiche fondamentali degli oli

I parametri importanti da considerare quando si sceglie il tipo di olio sono:

- la viscosità alle condizioni nominali di funzionamento
- gli additivi

Lo stesso olio, deve lubrificare sia i cuscinetti che gli ingranaggi e tutti questi componenti convivono all'interno della stessa scatola, in condizioni di funzionamento diverse. Consideriamo i singoli parametri.

Viscosità

La viscosità nominale è riferita ad una temperatura di 40 °C, ma diminuisce velocemente all'aumentare della temperatura. Se la temperatura di funzionamento è compresa tra 50 °C e 70 °C, si può scegliere una viscosità nominale secondo la seguente tabella indicativa, scegliendo la viscosità più elevata quando si prevede la temperatura più alta.

| n_2 [rpm] | 50° C | 70° C |
|----------------|---------------|---------------|
| $n_2 > 20$ | VG 150 | VG 220 |
| $20 > n_2 > 5$ | VG 220 | VG 320 |
| $n_2 > 5$ | VG 320 | VG 460 |

Particolare attenzione bisogna fare agli stadi in uscita molto caricati e con velocità molto basse (<1 giro/min). In questi casi bisogna ricorrere sempre ad oli con viscosità elevata e con una buona carica di additivazione Extreme Pressure (EP).

Additivi

Oltre ai normali additivi antischiuma ed antiossidanti, è importante utilizzare oli lubrificanti con additivi in grado di conferire proprietà EP (extremepressure) ed anti-usura, secondo ISO 6743-6 L-CKC o DIN 51517-3 CLP. Chiaramente quindi occorre ricercare prodotti con caratteristiche EP tanto più forti (tipo MOBILGEAR SHC) quanto più lenta è la velocità del riduttore. È opportuno ricordare che, i composti chimici sostitutivi della lubrificazione idrodinamica, si formano a scapito della carica EP originale. Quindi, in presenza di velocità molto basse e carichi elevati, è importante rispettare gli intervalli di manutenzione per non deprimerne eccessivamente le caratteristiche lubrificanti dell'olio.

17. LUBRICATION

DANA gear units are supplied without lubricant; therefore the user must carry out correct filling before starting the machine.

Fundamental characteristics of the oils

The important parameters to consider when choosing the type of oil are:

- viscosity at nominal operating conditions
- additives

The oil must lubricate the bearings and the gears and all these components work inside the same box, in different operating conditions. We will consider the individual parameters.

Viscosity

Nominal viscosity is referred to a temperature of 40 °C, but rapidly decreases with an increase in temperature. If the operating temperature is between 50 °C and 70 °C, a nominal viscosity can be chosen according to the following guide table, choosing the highest viscosity if the highest temperature is foreseen.

17. SCHMIERUNG

Die DANA - Getriebe werden ohne Schmieröl geliefert; der Benutzer muss dieselben vor der Inbetriebnahme der Maschine mit der vorschriftmäßigen Schmierölmenge füllen.

Grundlegende schmieröleigenschaften

Bei der Schmierölauswahl sind die folgenden wichtige Parameter zu berücksichtigen:

- Viskosität bei Nennbetriebsbedingungen
- Additive

Dasselbe Öl muss sowohl Lager wie auch Zahnräder schmieren und diese Bauteile funktionieren zusammen in demselben Gehäuse unter unterschiedlichen Betriebsbedingungen. Nachfolgend werden die einzelnen Parameter kurz beschrieben.

Viskosität

Die Nennviskosität bezieht sich auf eine Temperatur von 40 °C und nimmt mit der Zunahme der Temperatur rasch ab. Liegt die Betriebstemperatur zwischen 50 °C und 70 °C, kann eine Nennviskosität laut folgender Tabelle gewählt werden, wobei bei sehr hoher Temperatur die höchste Viskosität zu wählen ist.

Special attention must be paid to very loaded output stages and with very low speeds (<1 rpm). In such cases, always use high viscosity oils and with a good amount of Extreme Pressure (EP) additive.

Besonders vorsichtig muss man bei Abtriebsstufen unter hohen Lasten und mit niedriger Drehzahl (<1 U/min) sein. In diesen Fällen muss immer Schmieröl mit hoher Viskosität und einer ausreichenden Menge an E.P. Additiven eingesetzt werden.

Additives

In addition to the normal antifoaming and antioxidant additives, it is important to use lubricating oils with additives that provide EP (extremepressure) and antiwear properties, according to ISO 6743-6 L-CKC or DIN 51517-3 CLP. Therefore it will be necessary to find products with EP characteristics all the stronger (type MOBILGEAR SHC) the slower the gear unit speed. It should be remembered that the chemical compounds replacing hydrodynamic lubrication are formed to the detriment of the original EP load. Therefore, with very low speeds and high loads it is important to respect the maintenance periods so as not to excessively diminish the lubricating characteristics of the oil.

Additive

Neben den normalen Entschäumern und Oxidationshemmern müssen Schmieröle E.P. Additive (Extrem-Pressure) und verschleißhemmende Wirkstoffe laut ISO 6743-6 L-CKC oder DIN 51517-3 CLP enthalten. Es ist offensichtlich, dass dabei Produkte mit E.P. Eigenschaften (Typ MOBILGEAR SHC) zu wählen sind, die um so ausgeprägter sein müssen, je langsamer die Getriebedrehzahl ist. Es wird daran erinnert, dass sich die chemischen Substitutionsverbindungen der hydrodynamischen Schmierung zu Lasten des ursprünglichen EP-Gehalts bilden. Es ist daher bei sehr niedrigen Drehzahlen und hohen Belastungen sehr wichtig, dass die Wartungszeiträume zur Vermeidung einer übermäßigen Verschlechterung der Schmieröleigenschaften genau eingehalten werden.

17. LUBRIFICATION

Les réducteurs DANA sont livrés sans lubrifiant; Il incombe à l'utilisateur d'effectuer le remplissage correct avant la mise en service de la machine.

Caractéristiques fondamentales des lubrifiants

Les paramètres importants à considérer lors du choix du type de lubrifiant sont:

- la viscosité aux conditions nominales de fonctionnement
- les additifs ou dopes

La même huile doit pouvoir correctement lubrifier tant les roulements et que les engrenages et tous les composants renfermés dans le carter dans des conditions d'emploi différentes. Considérons à présent chacun des facteurs intervenant ici.

Viscosité

La viscosité nominale se rapporte à une température de 40 °C, mais elle diminue rapidement lorsque la température du réducteur s'élève. Si la température de fonctionnement est comprise entre 50 °C et 70 °C, il sera alors possible de choisir une viscosité nominale selon le tableau suivant, en choisissant la viscosité la plus élevée lorsque l'on prévoit la température d'emploi la plus élevée.

| n_2 [rpm] | 50° C | 70° C |
|----------------|---------------|---------------|
| $n_2 > 20$ | VG 150 | VG 220 |
| $20 > n_2 > 5$ | VG 220 | VG 320 |
| $n_2 > 5$ | VG 320 | VG 460 |

Il faut prêter une attention particulière aux étages en sortie très chargés et avec des vitesses très basses (<1 tr/min). Dans ces cas, il faut toujours recourir à des huiles avec une viscosité élevée et dopées EP extrême pression.

Additifs ou dopes

En plus des additifs antimousse et anticorrosion normaux, il est important d'utiliser d'autres huiles activées ou dopées [EP (extreme-pressure) et antiusure], selon la classification ISO 6743-6 L-CKC ou DIN 51517-3 CLP. Il est donc évident qu'il faut rechercher des produits dont les caractéristiques EP seront d'autant plus fortes (type MOBILGEAR SHC) que la vitesse de rotation du réducteur sera lente. Il est opportun de rappeler que: les composés chimiques de remplacement de la lubrification hydrodynamique se forment au détriment de la charge EP originale. En conséquence, dans le cas de vitesses très basses et de charges élevées, il est important de respecter les intervalles d'entretien pour éviter que les propriétés lubrifiantes de l'huile dégénèrent.

17. LUBRICACIÓN

Los reductores DANA se entregan sin lubricante; el usuario debe llenar el reductor antes de ponerlo en funcionamiento.

Características fundamentales de los aceites

Los parámetros importantes a la hora de elegir un aceite son:

- la viscosidad en condiciones nominales de funcionamiento
- los aditivos.

El mismo aceite debe lubricar a los cojinetes y a los engranajes. Estos componentes coexisten dentro de la misma carcasa en condiciones de funcionamiento diferentes. Examinemos cada factor por separado.

Viscosidad

La viscosidad nominal se mide por convención a 40 °C pero baja rápidamente si aumenta la temperatura. Si la temperatura de funcionamiento está entre 50 y 70 °C se puede elegir una viscosidad nominal en la siguiente tabla. Si existe la posibilidad de que la temperatura suba hay que elegir una viscosidad más alta.

17. LUBRIFICAÇÃO

Os redutores DANA são fornecidos sem lubrificante; o usuário deve efetuar o abastecimento correto antes da colocação da máquina em funcionamento.

Características fundamentais dos óleos

Os parâmetros importantes a serem considerados ao escolher o tipo de óleo são:

- a viscosidade nas condições nominais de funcionamento
- os aditivos

O próprio óleo, que deve lubrificar seja os coxins, seja as engrenagens e todos os componentes que convivem dentro da mesma caixa, em condições de funcionamento diferentes. Consideremos os parâmetros individuais.

Viscosidade

A viscosidade nominal refere-se a uma temperatura de 40 °C, mas diminui rapidamente com o aumento da temperatura. Se a temperatura de funcionamento estiver entre 50 °C e 70 °C, será possível escolher uma viscosidade nominal conforme a seguinte tabela indicativa, escolhendo-se a viscosidade mais elevada quando for prevista a temperatura mais elevada.

Cuando la velocidad de rotación de salida es muy baja (<1 rpm) y la carga es muy grande hay que prestar mucha atención. En estos casos se debe recurrir a aceites con alta viscosidad y alto contenido de aditivos Extreme Pressure (EP).

Deve-se prestar atenção especial aos estágios de saída muito carregados e com velocidades muito baixas (<1 rotação/min). Nesses casos será necessário recorrer sempre a óleos com viscosidade elevada e com uma boa carga de aditivos do tipo Extreme Pressure (EP).

Aditivos

Además de los agentes antiespuma y antioxidantes convencionales, es importante que los aditivos añadan al lubricante propiedades EP (presión extrema) y antidesgaste, con arreglo a las normas ISO 6743-6 L-CKC o DIN 51517-3 CLP. Las características EP deben ser más marcadas cuanto más lenta es la velocidad del reductor. Recuerde que: los compuestos químicos que reemplazan a la lubricación hidrodinámica se forman a expensas de la carga EP original. Por tanto, si las velocidades son muy bajas y las cargas muy altas hay que respetar el programa de mantenimiento para que el aceite no se degrade demasiado.

Aditivos

Além dos aditivos normais antiespuma e antioxidante, é importante utilizar óleos lubrificantes com aditivos capazes de conferir propriedades EP (extrema pressão) e anti-desgaste, conforme as normas ISO 6743-6 LCKC ou DIN 51517-3 CLP. É necessário, portanto, procurar produtos com características EP tanto mais fortes (tipo MOBILGEAR SHC) quanto mais lenta for a velocidade do reductor. É oportuno lembrar que os compostos químicos substitutivos da lubrificação hidrodinâmica formam-se em detrimento da carga EP original.

Dessa forma, na presença de velocidades muito baixas e cargas elevadas, será importante respeitar os intervalos de manutenção para não deteriorar excessivamente as características lubrificantes do óleo.

Tipi di oli

Gli oli disponibili appartengono generalmente a tre grandi famiglie.

- 1) Oli minerali
- 2) Oli sintetici Poli-Alfa-Olefine
- 3) Oli sintetici Poli-Glicole

La scelta più appropriata è generalmente legata alle condizioni di impiego.

I riduttori non particolarmente caricati e con un ciclo di impiego discontinuo senza escursioni termiche importanti, possono certamente essere lubrificati con olio minerale.

Nei casi di impiego gravoso, quando i riduttori saranno prevedibilmente caricati molto ed in modo continuativo, con conseguente prevedibile innalzamento della temperatura, è bene utilizzare lubrificanti sintetici tipo polialfaolefine (PAO).

Gli oli di tipo poliglicole (PG) sono da utilizzare strettamente nel caso di applicazioni con forti strisciamenti fra i contatti, ad esempio nelle viti senza fine. Debbono essere impiegati con grande attenzione poiché non sono compatibili con gli altri oli e sono invece completamente miscibili con l'acqua. Questo fenomeno è particolarmente pericoloso poiché non si nota, ma deprime velocemente le caratteristiche lubrificanti dell'olio.

Oltre a questi già menzionati, ricordiamo che esistono gli oli idraulici e gli oli per l'industria alimentare.

I primi vengono usati per il comando dei freni negativi. Per una maggiore tutela dell'ambiente sottolineiamo l'esistenza di alcuni tipi biodegradabili.

I secondi trovano specifico impiego nell'industria alimentare in quanto sono prodotti speciali non nocivi alla salute.

Vari produttori forniscono oli appartenenti a tutte le famiglie con caratteristiche molto simili. Più avanti proponiamo una tabella comparativa tra le marche più note.

Types of oils

The oils available generally belong to three big families.

- 1) Mineral oils
- 2) Poly-Alpha-Olefin synthetic oils
- 3) Poly-Glycol synthetic oils

The most suitable choice is generally tied to the conditions of use.

Gear units that are not particularly loaded and with a discontinuous operating cycle, without considerable temperature ranges, can certainly be lubricated with mineral oil.

In cases of heavy use, when the gear units are very loaded and in a continuous way, with resultant temperature increase, it is best to use polyalphaolefin synthetic lubricants (PAO).

Polyglycol oils (PG) are to be used strictly in the case of applications with heavy sliding between contacts, e.g. in worms. They must be employed with great care since they are not compatible with the other oils but are completely mixable with water. This phenomenon is particularly dangerous, since it is not noticed, but rapidly diminishes the lubricating characteristics of the oil.

In addition to the above, there are also hydraulic oils and oils for the food industry.

The former are used for the command of negative brakes. For better environmental protection there are several biodegradable types.

The latter have a specific use in the food industry since they are special products that are not harmful to the health.

Various producers supply oils belonging to all the families with very similar characteristics. A comparison table of the best known brands is given later on.

Schmierölsorten

Die verfügbaren Ölsorten gehören allgemein zu drei großen Familien

- 1) Mineralöle
- 2) Synthetische Poly-Alpha-Olefin-Öle
- 3) Synthetische Polyglykolöle

Die Auswahl hängt im Allgemeinen von den Einsatzbedingungen ab.

Getriebe, die nicht im Dauerbetrieb laufen und keinen großen Belastungen und großen Temperaturschwankungen ausgesetzt sind, können problemlos mit Mineralölen geschmiert werden.

Bei Einsatz unter erschwerten Bedingungen, bei denen die Getriebe voraussichtlich hohen Lasten im Dauerbetrieb mit der entsprechenden voraussehbaren Temperaturerhöhung ausgesetzt sind, ist es angebracht, synthetische Poly-Alpha-Olefin-Öle (PAO) zu verwenden.

Die Poly-Glykolöle (PG) werden in Anwendungen benutzt, in denen starke Gleitreibungen zwischen den Kontaktflächen auftreten, wie z. B. in Schnecken. Bei ihrer Anwendung ist sehr sorgfältig vorzugehen, da sie mit anderen Schmierölen unverträglich, aber voll mit Wasser vermischbar sind. Das ist besonders gefährlich, weil es unbemerkt erfolgt und sehr schnell die Schmiereigenschaften des Öls verschlechtert.

Neben den erwähnten Ölen gibt es noch Hydrauliköl und Öle für die Lebensmittelindustrie.

Die ersten werden auf Negativbremsen eingesetzt. Zum Umweltschutz weisen wir auf einige biologisch abbaubare Ölsorten hin.

Die zweiten werden von der Lebensmittelindustrie verwendet, da sie nicht gesundheitsschädlich sind.

Einige Hersteller liefern Schmieröle, die allen Familien mit sehr ähnlichen Merkmalen angehören. An anderer Stelle finden Sie eine Vergleichstabelle der bekanntesten Ölmarken.

Types des huiles

Les huiles disponibles appartiennent généralement à trois grandes familles.

- 1) Huiles minérales
 - 2) Huiles synthétiques polyalphaoléfines (PAO)
 - 3) Huiles synthétiques polyglycoles (PG)
- Le choix le plus adapté est généralement lié aux conditions d'emploi.

Les réducteurs assez peu chargés et avec un cycle de fonctionnement discontinu, sans variations de température importantes, peuvent certainement être lubrifiés à l'huile minérale.

Dans des conditions d'utilisation sévères, à savoir lorsque les engrenages sont très chargés et de manière continue, avec comme probable conséquence l'élévation de température, il convient d'utiliser des lubrifiants synthétiques type polyalphaoléfine (PAO). Les huiles de type polyglycoles (PG) conviennent particulièrement aux applications présentant d'importants frottements aux points de contact, comme par exemple dans les vis sans fin. Elles doivent être employées avec beaucoup de précautions, puisqu'elles ne sont pas compatibles avec les autres huiles et sont par contre totalement miscibles avec l'eau. Ce phénomène est d'autant plus dangereux qu'il n'est pas visible et dégrade rapidement les qualités de l'huile.

En sus de ces types déjà mentionnés, il est bon de rappeler qu'il existe des huiles hydrauliques et des huiles pour l'industrie alimentaire.

Les premiers sont employés pour la commande des freins négatifs. Il est bon d'indiquer ici l'existence de certains types biodégradables qui préservent le milieu naturel.

Les seconds conviennent à l'industrie alimentaire, car il s'agit de produits spéciaux qui ne sont pas nuisibles à la santé.

Noter que différents fabricants fournissent des huiles appartenant à toutes les familles avec des caractéristiques très similaires. Plus en avant, vous trouverez un tableau de comparaison des marques les plus connues.

Tipos de aceites

Los aceites se agrupan en tres grandes familias.

- 1) Aceites minerales
- 2) Aceites sintéticos polialfaolefinas
- 3) Aceites sintéticos poliglicoles

El criterio de selección más adecuado toma en cuenta las condiciones de empleo.

Los reductores que no soportan una carga particularmente grande y se someten a ciclos de trabajo discontinuos sin variacionesicas significativas pueden utilizar un aceite mineral.

La carga de los reductores para usos severos suele ser muy grande y continua, por lo que la temperatura tiende a subir. En estos casos se recomienda utilizar polialfaolefinas (PAO).

Los poliglicoles (PG) se deben utilizar solamente cuando el rozamiento es intenso, como por ejemplo en los tornillos sinfin. Hay que manejarlos con precaución porque son completamente solubles en agua pero también incompatibles con otros aceites. Este fenómeno es imperceptible pero muy peligroso porque degrada rápidamente al lubricante.

Además de los mencionados, existen aceites hidráulicos y aceites especiales para la industria alimentaria.

Los primeros se utilizan para los frenos negativos. Los biodegradables contribuyen a proteger el medioambiente.

Los segundos se emplean en la industria de la alimentación porque no son nocivos para la salud.

Existen varios fabricantes que disponen de aceites con características similares en cada una de las familias. Más adelante se incluye una tabla comparativa de las marcas más conocidas.

Tipos de óleo

Os óleos disponíveis pertencem geralmente a três grandes famílias.

- 1) Óleos minerais
- 2) Óleos sintéticos polialfaolefinas
- 3) Óleos sintéticos poliglicóis

A escolha mais apropriada é geralmente ligada às condições de emprego.

Os redutores não particularmente sujeitos a cargas elevadas e com um ciclo de trabalho descontínuo sem amplitudes térmicas relevantes podem certamente ser lubrificados com óleo mineral.

Nos casos de emprego rigoroso, quando os redutores forem provavelmente sujeitos a cargas muito elevadas e de modo contínuo, com o consequente e previsível aumento da temperatura, será melhor utilizar lubrificantes sintéticos do tipo polialfaolefinas (PAO). Os óleos de tipo poliglicóis (PG) devem ser utilizados especificamente no caso de aplicações com forte atrito entre os contatos, por exemplo, nos parafusos sem fim. Devem ser empregados com muita atenção porque não são compatíveis com os outros óleos e são, ao contrário, completamente misturáveis com a água. Esse fenômeno é particularmente perigoso porque não é observado, mas reduz rapidamente as características lubrificantes do óleo.

Além desses já mencionados, lembramos que existem os óleos hidráulicos e os óleos para a indústria alimentícia.

Os primeiros são usados para o comando dos freios negativos. Para uma maior proteção do meio ambiente, ressaltamos a existência de alguns tipos biodegradáveis.

Os últimos encontram emprego específico na indústria alimentícia pois são produtos especiais não nocivos à saúde. Vários produtores fornecem óleos pertencentes a todas as famílias com características muito semelhantes. Mais adiante propomos uma tabela comparativa entre as marcas mais conhecidas.

Contaminazione

Durante il normale funzionamento, a causa del rodaggio delle superfici, è inevitabile che si trasferiscano nell'olio delle microparticelle metalliche. Questa contaminazione, può accorciare la vita dei cuscinetti, mandando in avaria prematura il riduttore. Per limitare e controllare il fenomeno, senza ricorrere a frequenti e costosi cambi d'olio, occorre prevedere l'impiego di un opportuno sistema ausiliario di circolazione dell'olio.

Con questo sistema, si ottiene il doppio vantaggio di controllare il livello di contaminazione con l'impiego di appositi filtri e di stabilizzare la temperatura di funzionamento al livello più adeguato per garantire la viscosità voluta. Infatti, può succedere che la capacità termica specifica del riduttore è insufficiente a garantire un livello di temperatura di funzionamento corretto e stabile. Vedremo più avanti i sistemi ausiliari disponibili presso la DANA.

Per problemi di lubrificazione di riduttori destinati a impieghi particolari sia per la tipologia costruttiva, sia per i parametri di funzionamento, è consigliabile contattare il referente DANA di zona.

Contamination

During normal operation, due to running-in of the surfaces, metallic microparticles will inevitably form in the oil. This contamination can shorten the life of the bearings, resulting in early breakdown of the gear unit. To limit and control this phenomenon, without resorting to frequent and costly oil changes, a suitable auxiliary oil circulating system must be provided.

This system offers the dual advantage of controlling the level of contamination with the use of special filters and stabilizing the operating temperature at a level more suitable for guaranteeing the required viscosity. In fact, the specific thermal capacity of the gear unit is sometimes insufficient to ensure a correct and stable operating temperature level. The auxiliary systems available from DANA will be described later on.

For lubrication problems with gear units intended for particular uses, for construction type and operating parameters, it is advisable to consult the DANA area contact person.

Verschmutzung

Während des normalen Betriebs entstehen durch den Abrieb der Oberflächen Mikrometallpartikel im Öl. Diese Verschmutzung kann die Lebensdauer der Lager verkürzen und zu einem Ausfall des Getriebes führen. Zur Einschränkung dieser Erscheinung ohne häufigen und kostspieligen Ölwechsel ist der Einbau einer zusätzlichen Filteranlage des Schmieröls empfehlenswert.

Diese Anlage bietet den doppelten Vorteil, einseitig den Grad der Ölverschmutzung zu reduzieren und andererseits die Betriebstemperatur auf einer für die gewünschte Viskosität geeigneten Temperaturstufe zu stabilisieren. Es kann mitunter der Fall eintreten, dass die spezifische Wärmeleistung des Getriebes nicht ausreicht, eine korrekte und stabile Stufe der Betriebstemperatur zu gewährleisten. An anderer Stelle werden die bei DANA verfügbaren Hilfssysteme beschrieben.

Wenden Sie sich bei Schmierproblemen von Getrieben, Wir empfehlen Ihnen, Sich an die DANA Kontaktperson der zone zu wenden.

Contamination

Pendant le fonctionnement normal, à cause du rodage des surfaces, il est inévitable que des microparticules métalliques se transfèrent dans l'huile. Cette contamination peut diminuer la durée de vie des roulements et entraîner la défaillance prématûre du réducteur. Pour limiter et contrôler le phénomène, sans toutefois recourir à des renouvellements d'huile fréquents et onéreux, il faut prévoir l'emploi d'un système auxiliaire de circulation de l'huile.

Ce système présente le double avantage de pouvoir contrôler le niveau de contamination à l'aide de filtres spécifiques et de pouvoir stabiliser la température de fonctionnement au niveau le plus adapté pour garantir la viscosité voulue. En fait, il se peut que la puissance thermique spécifique du réducteur soit insuffisante à garantir un degré de température de fonctionnement correct et stable. Nous donnerons plus en avant les systèmes auxiliaires disponibles chez DANA.

Pour les problèmes de lubrification des réducteurs destinés à des applications particulières, tant pour le type de construction que pour les paramètres de fonctionnement, nous vous recommandons de consulter la personne de référence de la zone DANA.

Contaminación

El rodaje de las superficies durante el funcionamiento normal hace que las micropartículas metálicas migren inevitablemente hacia el aceite. Este tipo de contaminación acorta la vida de los rodamientos y puede determinar una avería prematura del reductor. Para limitar el fenómeno, en lugar de recurrir a frecuentes y costosos cambios de aceite hay que instalar un circuito auxiliar de circulación.

Esta solución tiene dos ventajas: los filtros reducen la contaminación y la temperatura de funcionamiento se estabiliza en un valor que asegura la viscosidad necesaria. Puede suceder que la capacidad térmica específica del reductor no alcance a garantizar una temperatura de funcionamiento adecuada y estable. Más adelante se suministra la lista de sistemas auxiliares de la gama DANA.

Para resolver cualquier problema relacionado con la lubricación de reductores para usos especiales (construcción del circuito, ajuste, etc.) le recomendamos que consulte a la persona de contacto del área de DANA.

Contaminação

Durante a operação normal, em função da lapidação das superfícies, é inevitável a transferência de micropartículas metálicas para a água. Essa contaminação pode reduzir a vida útil dos coxins, provocando a avaria prematura do redutor. Para limitar e controlar o fenômeno, sem recorrer a freqüentes e custosas trocas de óleo, é necessário prever o emprego de um sistema auxiliar apropriado de circulação do óleo.

Com esse sistema se obtém uma dupla vantagem, de controlar o nível de contaminação com o emprego de filtros apropriados e estabilizar a temperatura de funcionamento ao nível mais adequado para garantir a viscosidade desejada. Efetivamente, a capacidade térmica específica do redutor pode ser insuficiente para garantir um nível de temperatura de funcionamento correto e estável. Veremos mais adiante os sistemas auxiliares disponíveis junto à DANA.

Para problemas de lubrificação de motores destinados a empregos particulares, seja pelo tipo costrutivo, seja pelos parâmetros de funcionamento, recomendamos que você consulte seu contato local da DANA.

18. INDICAZIONI CONTROLLO OLI CON LUBRIFICAZIONE NON FORZATA

Montaggio orizzontale Posizione livelli

Nel caso di montaggio orizzontale del riduttore, il normale livello per garantire una corretta lubrificazione è posto sulla mezzeria, Fig. (7). Per applicazioni con velocità di rotazione in uscita molto bassa ($n_2 \leq 5$ rpm) è consigliabile fissare il livello ad una quota superiore di 50-100 mm, Fig. (8).

E' possibile verificare con facilità il corretto livello utilizzando un tubo trasparente posizionato come da figura.

Nel caso in cui la velocità di uscita sia estremamente bassa ($n_2 \leq 1$ rpm), oppure se sono prevedibili lunghi periodi di ferma del riduttore, è consigliabile riempire tutta la scatola. In questo caso occorre prevedere l'impiego di un apposito serbatoio ausiliario (vedere il capitolo seguente).

Volendo montare uno strumento che consenta la verifica visiva del livello (o tramite apposito segnale elettrico), occorre eseguire un montaggio secondo lo schema Fig.(9). Montare il tappo di sfiato al di sopra dell'indicatore di livello tramite un tubo abbastanza lungo, collegando la parte superiore (vuota) del riduttore appena sotto allo sfiato. In questo modo si eviterà la fuoriuscita di olio.

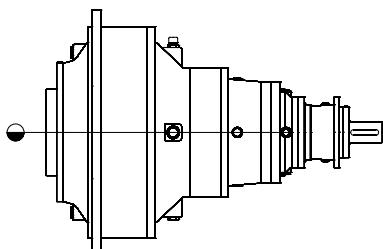

Fig. 7

18. INDICATIONS FOR OIL CONTROL DIAGRAMS WITHOUT AUXILIARY COOLING SYSTEM

Horizontal mounting Position of levels

With horizontal mounting of the gear unit, the normal level for guaranteeing correct lubrication is located at the centre line. Fig. (7). For applications with very low output rotation speed ($n_2 \leq 5$ rpm) it is advisable to fix the level at a value higher than 50-100 mm. Fig. (8).

The correct level can be easily checked using a transparent tube positioned as shown in the figure.

If the output speed is extremely low ($n_2 \leq 1$ rpm), or if long gear unit downtimes are foreseen, it is advisable to fill the entire box. In this case a special auxiliary tank must be provided (see the next chapter). To fit an instrument for visually checking the level (or by means of a special electric signal), assembly must be done according to the drawing in Fig. (9). Locate the breather plug over the instrument by mean of a long tube. Connect the upper (empty) part of the gearbox just under the breather by mean of a bleeding tube to prevent oil leakage.

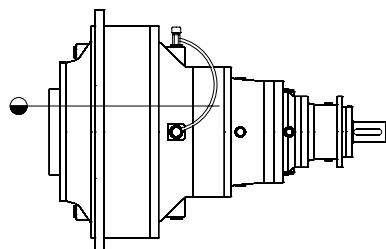

Fig. 8

18. HINWEISE FÜR DIE ÖLKONTROLLE OHNE DRUCKSCHMIERUNG

Horizontale Einbaulage Füllstände

Bei horizontalem Getriebeeinbau liegt der normale Füllstand für eine störungsfreie Schmierung auf der Mittellinie, Abb. (7). Bei Anwendungen mit äußerst niedrigen Abtriebsdrehzahlen ($n_2 \leq 5$ U/min) sollte der Füllstand um 50 - 100 mm höher liegen. Abb. (8).

Der vorschriftsmäßige Füllstand kann leicht mit einem durchsichtigen Schlauch kontrolliert werden (siehe Abbildung Bei extrem niedriger Abtriebsdrehzahl ($n_2 \leq 1$ U/min) oder bei voraussichtlichen langen Stillstandzeiten des Getriebes ist es angebracht, das Gehäuse vollständig zu füllen. In diesem Fall ist ein besonderes Zusatzgefäß einzusetzen (siehe das folgende Kapitel).

Falls eine Sichtkontrolle des Ölstands (oder eine Kontrolle mittels eines elektrischen Signals) gewünscht wird, muss die Installation laut Schema der Abb. 9 vorgenommen werden. Die Entlüfterkappe auf dem Füllstandanzeiger mit einem ausreichend langen Schlauch montieren und den oberen (leeren) Teil des Getriebes knapp unter dem Entlüfter anschließen. Auf diese Weise wird das Austreten von Schmieröl verhindert.

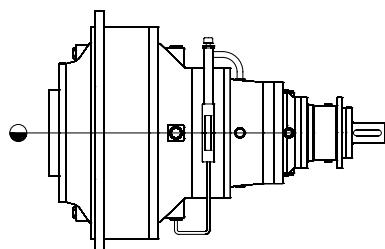

Fig. 9

18. INDICATIONS POUR LE CONTRÔLE DE L'HUILE AVEC UNE LUBRIFICATION PAR CIRCULATION NON FORCÉE

Montage horizontal Position des niveaux

Dans le cas de montage du réducteur en position horizontale, le niveau d'huile pour une lubrification correcte doit se situer à mi-hauteur, Fig. (7). Pour les applications prévoyant une vitesse de rotation en sortie très basse ($n_2 \leq 5$ tr/min), il est préférable de fixer le niveau à une cote supérieure à 50-100 mm. Fig. (8).

Pour vérifier facilement le niveau correct, utiliser un tube transparent positionné comme indiqué en figure.

Dans le cas de vitesse de sortie extrêmement basse ($n_2 \leq 1$ tr/min) ou de longues périodes d'arrêt du réducteur, il est préférable de remplir tout le carter. Dans ce cas, il faut prévoir l'utilisation d'un réservoir auxiliaire prévu à cet effet (voir chapitre suivant).

Pour monter un indicateur permettant le contrôle visuel du niveau (ou par un signal électrique), il faut réaliser le montage selon le schéma Fig.(9).

Monter le bouchon reniflard au-dessus de l'indicateur de niveau en utilisant un tube assez long, en reliant la partie supérieure (vide) du réducteur juste en dessous du reniflard. Ceci pour éviter la sortie d'huile.

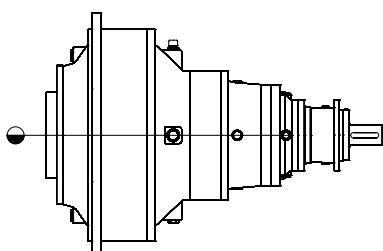

Fig. 7

18. INSPECCIÓN EN CASO DE LUBRICACIÓN NO FORZADA

Montaje horizontal Posición de los niveles

En caso de montaje horizontal del reduedor, el nivel indispensable para garantizar una buena lubricación coincide con la línea media, Fig. 7. En las aplicaciones en las que la velocidad de rotación de salida es muy baja ($n_2 \leq 5$ rpm) el nivel se debe fijar 50 a 100 mm más arriba. Fig. (8). El nivel se puede verificar fácilmente con la ayuda de un tubo transparente como se observa en la figura.

Si la velocidad de salida es extremadamente baja ($n_2 \leq 1$ rpm) o el reduedor debe atravesar largos períodos de inactividad, se aconseja llenar todo el depósito. Está prevista la instalación de un depósito auxiliar (véase el capítulo siguiente). Si se desea montar un instrumento de verificación visual o eléctrica se aconseja aplicar el esquema de la Fig. 9. Colocar el tapón de purga por encima del indicador de nivel por medio de un tubo suficientemente largo conectando la parte superior (vacía) del reduedor inmediatamente debajo del orificio de purga. De esta forma se evitará que el aceite se derrame.

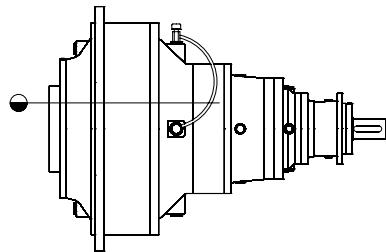

Fig. 8

18. INDICAÇÕES DE CONTROLE DE ÓLEO COM LUBRIFICAÇÃO NÃO FORÇADA

Montagem horizontal Posição dos níveis

No caso de montagem horizontal do redutor, o nível normal para garantir uma lubrificação correta está colocado na linha central (fig. 7). Para aplicações com velocidades de rotação muito baixa na saída ($n_2 \leq 5$ rpm) é aconselhável fixar o nível a uma quota superior de 50 a 100 mm. (Fig. 8).

É possível verificar com facilidade o nível correto utilizando um tubo transparente como mostrado na figura.

Caso a velocidade de saída seja extremamente baixa ($n_2 \leq 1$ rpm), ou se forem previstos períodos longos de parada do redutor, será aconselhável encher toda a carcaça. Nesse caso, será necessário empregar um reservatório auxiliar apropriado (consultar o capítulo seguinte).

Desejando montar um instrumento que permita verificar visualmente o nível (ou através de um sinal elétrico apropriado), será necessário efetuar uma montagem segundo o esquema da fig. 9. Montar o bujão de respiro acima do indicador de nível através de um tubo comprido o suficiente, conectando a parte superior (vazia) do redutor imediatamente abaixo do respiro. Desse modo se evitara a saída de óleo.

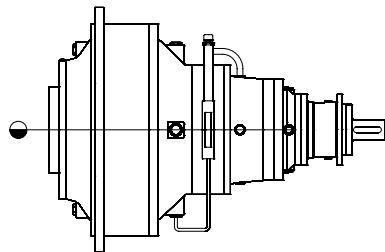

Fig. 9

Vaso di espansione

Nel caso di montaggio verticale e, comunque, ogni volta si renda necessario riempire completamente il riduttore, occorre rispettare alcune regole. All'atto del riempimento, nella parte superiore, in corrispondenza della tenuta rotante dell'albero di uscita, si può formare una bolla d'aria, che deve essere eliminata per evitare l'insufficiente lubrificazione della tenuta stessa. Inoltre sapendo che il volume dell'olio aumenta con la temperatura, occorre predisporre un serbatoio ausiliario che consenta all'olio di espandersi senza creare pericolose pressioni interne al riduttore.

Expansion tank

Several rules must be followed with vertical mounting, and in any case whenever the gear unit has to be completely filled. During filling, an air bubble can form in the upper part, at the output shaft revolving seal, and which must be eliminated in order to avoid insufficient lubrication of the seal. Also, since the volume of oil increases with the temperature, an auxiliary tank must be provided to allow the oil to expand without creating dangerous pressures inside the gear unit.

Expansionsgefäß

Bei vertikalem Einbau und in allen Fällen, in denen das Getriebe vollständig gefüllt werden muss, sind einige wichtige Regeln einzuhalten. Während des Füllens kann sich im oberen Teil in Höhe der Wellendichtung eine Luftblase bilden, die zur Vermeidung ungenügender Schmierung beseitigt werden muss. Da sich das Ölvolume mit steigender Temperatur erhöht, muss ein Hilfsbehälter eingebaut werden, der die Ausdehnung des Öls ausgleicht und gefährliche Drücke im Inneren des Getriebes verhindert.

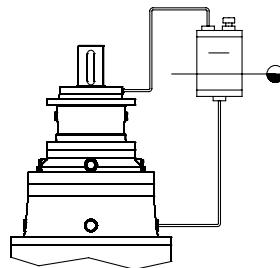

Fig. 10

Per il dimensionamento occorre determinare il volume (V_e) di espansione dell'olio alla temperatura di funzionamento:

For dimensioning, the oil expansion volume (V_e) at operating temperature must be determined:

$$V_e = V_t \times \Delta T / 1000$$

V_t = volume totale dell'olio

ΔT = differenza tra temperatura di funzionamento e temperatura ambiente

La capacità (V_s) del vaso di espansione è:

V_t = total volume of oil

ΔT = difference between operating temperature and ambient temperature

The capacity (V_s) of the expansion tank is:

$$V_s = 2 \times V_e$$

Per eliminare l'eventuale aria residua, devono essere collegati il foro presente nella zona più alta del riduttore e la parte superiore del vaso di espansione; quest'ultimo deve essere posto ad una altezza tale da garantire il pieno riempimento del riduttore al livello minimo. Si consiglia di realizzare il tubo di spurgo o lo stesso vaso di espansione con materiale trasparente, per poter verificare con facilità l'esatta posizione del livello del lubrificante.

To remove any residual air, the holes in the top part of the gear unit and the upper part of the expansion tank must be connected; the latter must be located at a height guaranteeing complete filling of the gear unit up to the minimum level. It is advisable to make the bleeding tube or the expansion tank with transparent material, to be able to easily check the exact position of the lubricant level.

Für die Bemessung des Behälters muss das Ausdehnungsvolumen (V_e) des Öls bei Betriebstemperatur berechnet werden:

V_t = Gesamte Ölmenge

ΔT = Unterschied zwischen Betriebs- und Umgebungstemperatur

Das Aufnahmevermögen (V_s) des Expansionsbehälters ist:

Zur Entlüftung der Restluft ist die Bohrung im höchsten Teil des Getriebes mit dem Oberteil des Expansionsgefäßes zu verbinden; letzteres muss auf einer Höhe angeordnet werden, die gewährleistet, dass das Getriebe immer bis zum Mindeststand gefüllt ist. Es ist angebracht, einen Entlüftungsschlauch und ein Expansionsgefäß aus durchsichtigem Material zu verwenden, um jederzeit auf leichte Weise den Schmierölstand kontrollieren zu können.

Vase d'expansion

Dans le cas de montage du réducteur en position verticale et, de toute façon, chaque fois qu'il est nécessaire de remplir complètement le réducteur, il faut respecter certaines règles.

Au moment du remplissage, dans la partie supérieure, au niveau du joint tournant de l'arbre de sortie, il peut se former une bulle d'air qui doit être éliminée pour éviter l'insuffisance de lubrification dudit joint. En outre, du fait que le volume de l'huile augmente avec la température, il faut prévoir un réservoir auxiliaire permettant à l'huile de se détendre sans créer des pressions dangereuses dans le réducteur.

Depósito de expansión

En caso de montaje vertical y toda vez que se debe llenar el redutor, hay que respetar algunas reglas.

A la altura de la guarnición giratoria del eje de salida se puede formar al llenar una burbuja de aire. Para que la guarnición quede bien lubricada hay que eliminarla. Como además el volumen del aceite aumenta con la temperatura, hay que instalar un depósito auxiliar para que la expansión del aceite no haga aumentar la presión dentro del redutor.

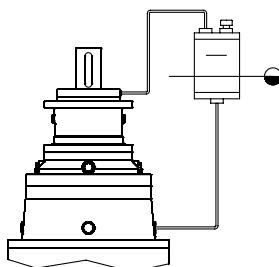

Fig. 10

Pour le dimensionnement, il faut déterminer le volume (V_e) d'expansion de l'huile à la température de fonctionnement:

Para determinar el tamaño del depósito auxiliar hay que averiguar el volumen (V_e) de expansión del aceite a la temperatura de funcionamiento:

$$V_e = V_t \times \Delta T / 1000$$

V_t = volume total de l'huile

ΔT = différence ou écart température de fonctionnement et température ambiante

La capacité (V_s) du vase d'expansion est:

V_t = volumen total de aceite

ΔT = diferencia entre la temperatura ambiente y la de funcionamiento

La capacidad (V_s) del depósito de expansión es:

$$V_s = 2 \times V_e$$

Pour éliminer l'air résiduel éventuel, l'orifice situé dans la partie la plus haute du réducteur et la partie supérieure du réservoir d'expansion doivent être reliés; ce dernier doit être situé à une hauteur suffisante pour garantir le remplissage du réducteur jusqu'au niveau minimum. Il est conseillé d'utiliser un tube de purge ou un vase d'expansion transparent, afin de faciliter l'examen visuel du niveau du lubrifiant.

Para eliminar el aire residual el agujero que está en la parte más alta del redutor se debe conectar con la parte superior del vaso de expansión, cuya altura debe a su vez permitir que el redutor se llene hasta el nivel mínimo. Se aconseja realizar el tubo de purga y el depósito de expansión en un material transparente para que sea más fácil inspeccionar el nivel.

Vaso de expansão

No caso de montagem vertical e, de qualquer modo, toda vez que for necessário reabastecer completamente o redutor, será necessário respeitar algumas regras.

No ato do reabastecimento, na parte superior, em correspondência ao retentor giratório do eixo de saída, é possível a formação de uma bolha de ar, que deverá ser eliminada para evitar a lubrificação insuficiente do próprio retentor. Além disso, sabendo que o volume do óleo aumenta com a temperatura, será necessário colocar um reservatório auxiliar que permita a expansão do óleo sem criarpresões perigosas dentro do redutor.

Para o dimensionamento é necessário determinar o volume (V_e) de expansão do óleo à temperatura de funcionamento:

V_t = volume total do óleo

ΔT = diferença entre a temperatura de funcionamento e a temperatura ambiente

A capacidade (V_s) do vaso de expansão é de:

Para eliminar o ar residual eventual, deverão ser conectados o furo presente na zona mais alta do redutor e a parte superior do vaso de expansão; este último deve ser colocado a uma altura tal que garanta o enchimento completo do redutor ao nível mínimo. É aconselhável realizar o tubo de expurgo ou o próprio vaso de expansão com material transparente, para poder verificar com facilidade a posição exata do nível do lubrificante.

Montaggio verticale in linea e versioni ortogonali

I riduttori debbono essere completamente pieni, quindi occorre montare il vaso di espansione. Come detto in precedenza, è molto importante collegare lo sfiato superiore del riduttore al vaso di espansione per consentire all'olio di risalire fino all'anello di tenuta rotante dell'albero superiore del riduttore.

Volendo montare uno strumento che consente la verifica visiva (o tramite apposito segnale elettrico), lo strumento sarà collocato sul fianco del serbatoio.

Vertical mounting in-line and right-angle versions

The gear units must be completely full, then the expansion tank must be fitted. As already stated, it is very important to connect the top breather to the expansion tank in order to allow the oil to rise up to the rotating seal ring of the gear unit upper shaft.

To fit an instrument for visual checking (or by means of a special electric signal), the instrument must be placed on the side of the tank.

Vertikaleinbau von In-Line- und Winkelgetrieben

Die Getriebe müssen vollständig gefüllt sein; daher ist immer ein Expansionsbehälter erforderlich. Wie bereits ausgeführt wurde, ist es sehr wichtig, dass die obere Entlüftung des Getriebes an das Expansionsgefäß angeschlossen wird, damit das Schmieröl die Wellendichtung der oberen Getriebewelle erreichen kann. Falls eine Sichtkontrolle des Ölstands (oder eine Kontrolle mittels eines elektrischen Signals) gewünscht wird, muss das Gerät auf der Seite des Behälters angeordnet werden.

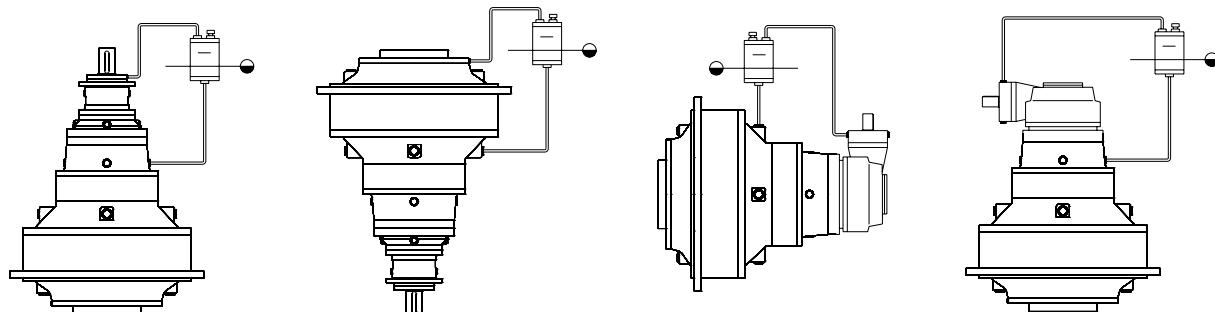

Fig. 11

Sistemi ausiliari di raffreddamento e filtrazione

Nel caso la potenza trasmessa sia superiore alla potenza termica dissipabile dal riduttore, è necessario l'impiego di un sistema ausiliario di raffreddamento, in grado di smaltire la potenza termica in eccedenza e di mantenere anche un buon livello di pulizia dell'olio lubrificante, attraverso la filtrazione continua.

Per assolvere questa funzione, la DANA propone tre unità di raffreddamento in grado di dissipare rispettivamente 5, 10, 20 kW.

Auxiliary cooling and filtering systems

If the power transmitted is higher than the thermal power that can be dissipated by the gear unit, an auxiliary cooling system able to dissipate the excess thermal power and also maintain a good level of cleaning of the lubricating oil through constant filtering, must be used.

To carry out this function, DANA proposes three cooling units able to dissipate 5, 10, 20 kW respectively.

Zusätzliche kühl- und filteranlage

Falls die übertragene Leistung höher ist als die vom Getriebe abführbare Wärmeleistung muss ein zusätzliches Kühl-System installiert werden, das in der Lage ist, die überschüssige Wärmeleistung abzuführen und durch Dauerfilterung das Schmieröl auf einem ausreichend sauberen Niveau zu halten.

DANA bietet zu diesem Zweck drei Kühlseinheiten mit einer Wärmeverdissipation von jeweils 5, 10, 20 kW an.

Montage vertical en ligne et versions orthogonales

Les réducteurs devant être complètement remplis, il faut donc monter le réservoir d'expansion. Ainsi qu'on l'a dit précédemment, il est très important de relier la purge supérieure du réducteur au vase d'expansion pour permettre à l'huile de remonter jusqu'au joint tournant de l'arbre supérieur du réducteur.

Si l'on veut monter un instrument permettant l'examen visuel (ou par signal électrique), celui-ci devra être placé à côté du réservoir.

Montaje vertical en línea y versiones perpendiculares

Como los reductores deben estar completamente llenos, en ambos casos hay que montar el depósito de expansión. Es muy importante conectar la purga superior del reductor con el vaso de expansión para que el aceite suba hasta la garnición giratoria del eje superior del reductor.

Si se desea montar un instrumento de verificación visual o eléctrica hay que colocarlo junto al depósito.

Montagem vertical em linha e versões ortogonais

Os redutores devem ser completamente cheios e, assim, é necessário montar o vaso de expansão. Como mencionado anteriormente, é muito importante conectar o respiro superior do redutor no vaso de expansão para permitir a subida do óleo até o anel de retenção giratório do eixo superior do redutor.

Desejando montar um instrumento que permita uma verificação visual (ou através de um sinal elétrico apropriado), o instrumento será colocado ao lado do reservatório.

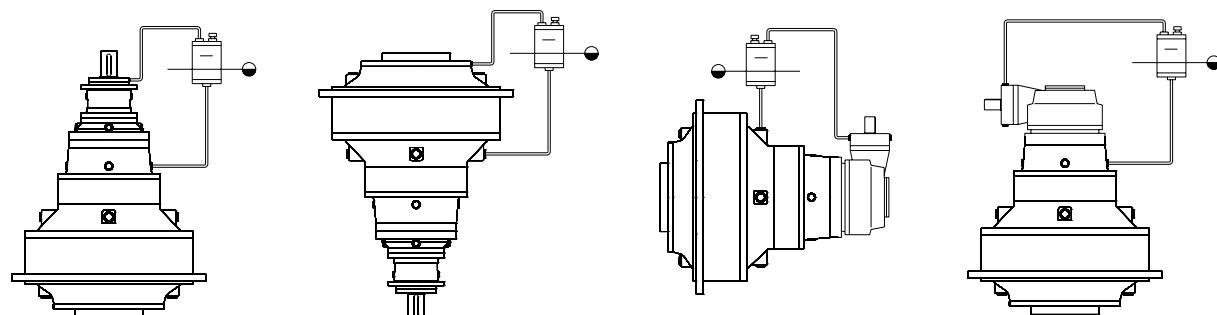

Fig. 11

Systèmes auxiliaires de refroidissement et de filtration

Dans le cas où la puissance transmise est supérieure à la puissance thermique pouvant être dissipée par le réducteur, il faudra prévoir l'adoption d'un système auxiliaire de refroidissement capable d'évacuer la puissance thermique en excès et de maintenir également un bon degré de propreté du lubrifiant à travers une filtration continue.

Pour remplir cette fonction, DANA propose trois unités de refroidissement pouvant dissiper respectivement 5, 10, 20 kW.

Sistemas auxiliares de enfriamiento y filtrado

Si la fuerza transmitida es mayor que la potencia térmica que puede disipar el reductor hay que instalar un sistema auxiliar de enfriamiento con filtrado continuo que elimine el exceso de temperatura y mantenga el aceite lubricante siempre limpio.

DANA fabrica tres unidades de enfriamiento opcionales que disipan 5, 10 y 20 kW respectivamente.

Sistemas auxiliares de arrefecimento e filtragem

Caso a potência transmitida seja superior à potência térmica dissipável do redutor, será necessário empregar um sistema auxiliar de arrefecimento capaz de absorver a potência térmica em excesso e de também manter um bom nível de limpeza do óleo lubrificante através de uma filtragem contínua.

Para efetuar essa função, a DANA propõe três unidades de arrefecimento capazes de dissipar respectivamente 5, 10 e 20 kW.

Technologies Customized to **Every Part of the Globe**

With a presence in 33 countries, Dana Incorporated boasts more than 145 engineering, manufacturing, and distribution facilities. Our worldwide network of local service centers provides assurance that each customer will benefit from the local proximity and responsiveness.

About Dana Incorporated

Dana is an integral partner for virtually every major vehicle and engine manufacturer worldwide. We are a leading supplier of drivetrain, sealing, and thermal technologies to the global automotive, commercial-vehicle, and off-highway markets. Founded in 1904, we employ thousands of people across six continents.

About Dana Off-Highway Drive and Motion Technologies

Dana delivers fully optimized Spicer® drivetrain and Brevini® motion systems to customers in construction, agriculture, material-handling, mining, and industrial markets. We bring our global expertise to the local level with technologies customized to individual requirements through a network of strategically located technology centers, manufacturing locations, and distribution facilities.

Learn more about Dana's drivetrain and motion systems at
dana.com/offhighway.
